

Generic Security Service Application Program Interface (GSS-API)  
Domain-Based Service Names Mapping for the Kerberos V GSS Mechanism

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document describes the mapping of Generic Security Service Application Program Interface (GSS-API) domain-name-based service principal names onto Kerberos V principal names.

Table of Contents

1. Domain-Based Names for the Kerberos V GSS-API Mechanism . . . .	2
2. Conventions Used in This Document . . . . .	2
3. Internationalization Considerations . . . . .	2
4. Examples . . . . .	3
5. Security Considerations . . . . .	3
6. Normative References . . . . .	3

## 1. Domain-Based Names for the Kerberos V GSS-API Mechanism

In accordance with [RFC5178], this document provides the mechanism-specific details needed to implement GSS-API [RFC2743] domain-based service names with the Kerberos V GSS-API mechanism [RFC4121].

GSS\_C\_NT\_DOMAINBASED\_SERVICE name SHOULD be mapped to Kerberos V principal names as follows:

- o the <service> name becomes the first (0th) component of the Kerberos V principal name;
- o the <hostname> becomes the second component of the Kerberos V principal name;
- o the <domain> name becomes the third component of the Kerberos V principal name;
- o the realm of the resulting principal name is that which corresponds to the domain name, treated as a hostname.

The same name canonicalization considerations and methods as used elsewhere in the Kerberos V GSS-API mechanism [RFC4121] and Kerberos V [RFC4120] in general apply here.

Implementations SHOULD use a Kerberos V name-type of NTT-SRVT-HST-DOMAIN (which has the value 12) but MAY use NT-UNKNOWN instead.

## 2. Conventions Used in This Document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

## 3. Internationalization Considerations

It is unclear, at this time, how best to address internationalization of Kerberos V domain-based principal names. This is because the Kerberos V core protocol internationalization project is incomplete.

However, clearly the best way to interoperate when using Kerberos V domain-based principal names is to use ACE-encoded internationalized domain names [RFC3490] for the hostname and domain name slots of a Kerberos V domain-based principal name. Therefore Kerberos V GSS-API mechanism implementations MUST do just that.

#### 4. Examples

- o The domain-based name, of generic form, "ldap@foo.example@dsl.foo.example" may map to a Kerberos V principal name like: "ldap/dsl.foo.example/foo.example@FOO.EXAMPLE"
- o The domain-based name, of generic form, "kadmind@foo.example@kdc1.foo.example" may map to a Kerberos V principal name like: "kadmind/kdc1.foo.example/foo.example@FOO.EXAMPLE"

#### 5. Security Considerations

See [RFC5178].

It is important for the security of protocols using the Kerberos V GSS-API mechanism and domain-based names, that the realm of domain-based principal names be derived from the hostname, rather than the domain name slots of the input domain-based name string.
