

The `hhline` package*

David Carlisle

1994/05/23

Abstract

`\hhline` produces a line like `\hline`, or a double line like `\hline\hline`, except for its interaction with vertical lines.

1 Introduction

The argument to `\hhline` is similar to the preamble of an `array` or `tabular`. It consists of a list of tokens with the following meanings:

- = A double hline the width of a column.
- A single hline the width of a column.
- ~ A column with no hline.
- | A vline which ‘cuts’ through a double (or single) hline.
- :
- : A vline which is broken by a double hline.
- # A double hline segment between two vlines.
- t The top half of a double hline segment.
- b The bottom half of a double hline segment.
- * `*{3}{==#}` expands to `==##==#`, as in the `*`-form for the preamble.

If a double vline is specified (|| or ::) then the hlines produced by `\hhline` are broken. To obtain the effect of an hline ‘cutting through’the double vline, use a # or omit the vline specifiers, depending on whether or not you wish the double vline to break.

The tokens t and b must be used between two vertical rules. |tb| produces the same lines as #, but is much less efficient. The main use for these are to make constructions like |t:| (top left corner) and :b| (bottom right corner).

If `\hhline` is used to make a single hline, then the argument should only contain the tokens -, ~ and | (and *-expressions).

An example using most of these features is:

```
\begin{tabular}{||c||c|c||}
\hhline{|t:::t:::t|} % 3 double lines
a&b&c&d\\
\hhline{|:::|~|~||} % 2 double lines, 2 vlines
1&2&3&4\\
\hhline{#==#~|=#} % 1 double line, 1 vline
i&j&k&l\\
\hhline{||--||--||} % 2 single lines
w&x&y&z\\
\hhline{|b:::b:::b|} % 3 single lines
\end{tabular}
```

a	b	c	d
1	2	3	4
i	j	k	l
w	x	y	z

*This file has version number v2.03, last revised 1994/05/23.

The lines produced by L^AT_EX's `\hline` consist of a single (T_EX primitive) `\hrule`. The lines produced by `\hhline` are made up of lots of small line segments. T_EX will place these very accurately in the `.dvi` file, but the program that you use to print the `.dvi` file may not line up these segments exactly. (A similar problem can occur with diagonal lines in the `picture` environment.)

If this effect causes a problem, you could try a different driver program, or if this is not possible, increasing `\arrayrulewidth` may help to reduce the effect.

2 The Macros

1 <code>(*package)</code>	
<code>\HH@box</code>	Makes a box containing a double hline segment. The most common case, both rules of length <code>\doublerulesep</code> will be stored in <code>\box1</code> , this is not initialised until <code>\hhline</code> is called as the user may change the parameters <code>\doublerulesep</code> and <code>\arrayrulewidth</code> . The two arguments to <code>\HH@box</code> are the widths (ie lengths) of the top and bottom rules.
2 <code>\def\HH@box#1#2{\vbox{%</code>	
3 <code>\hrule \@height \arrayrulewidth \@width #1</code>	
4 <code>\vskip \doublerulesep</code>	
5 <code>\hrule \@height \arrayrulewidth \@width #2}}</code>	
<code>\HH@add</code>	Build up the preamble in the register <code>\toks0</code> .
6 <code>\def\HH@add#1{\toks0\expandafter{\the\toks0#1}}</code>	
<code>\HH@xexpast</code>	We 'borrow' the version of <code>\@xexpast</code> from Mittelbach's <code>array.sty</code> , as this allows <code>#</code> to appear in the argument list.
7 <code>\def\HH@xexpast#1#2#3#4\@@{%</code>	
8 <code>\@tempcnta #2</code>	
9 <code>\toks0={#1}\@temptokena={#3}%</code>	
10 <code>\let\the\toksz\relax \let\the\toks\relax</code>	
11 <code>\def\@tempaf{\the\toksz}%</code>	
12 <code>\ifnum\@tempcnta > 0 \@whilenum\@tempcnta >0\do</code>	
13 <code>{\edef\@tempaf{\@tempa\the\toks}\advance\@tempcnta \m@ne}%</code>	
14 <code>\let\@tempb \HH@xexpast \else</code>	
15 <code>\let\@tempb \HH@xexnoop \fi</code>	
16 <code>\def\the\toksz{\the\toks0}\def\the\toks{\the\@temptokena}%</code>	
17 <code>\edef\@tempa{\@tempa}%</code>	
18 <code>\expandafter\@tempb \@tempa #4\@@}</code>	
19	
20 <code>\def\HH@xexnoop#1\@@{}}</code>	
<code>\hhline</code>	Use a simplified version of <code>\@mkpream</code> to break apart the argument to <code>\hhline</code> . Actually it is oversimplified, It assumes that the vertical rules are at the end of the column. If you were to specify <code>c @{xx} </code> in the array argument, then <code>\hhline</code> would not be able to access the first vertical rule. (It ought to have an <code>@</code> option, and add <code>\leaders</code> up to the width of a box containing the <code>@</code> -expression. We use a loop made with <code>\futurelet</code> rather than <code>\@tfor</code> so that we can use <code>#</code> to denote the crossing of a double hline with a double vline. <code>\if@firststamp</code> is true in the first column and false otherwise. <code>\if@tempswa</code> is true if the previous entry was a vline (<code>:</code> , <code> </code> or <code>#</code>).
21 <code>\def\hhline#1{\omit\@firststamptrue\@tempswafalse</code>	
Put two rules of width <code>\doublerulesep</code> in <code>\box1</code>	
22 <code>\global\setbox\@ne\HH@box\doublerulesep\doublerulesep</code>	
If Mittelbach's <code>array.sty</code> is loaded, we do not need the negative <code>\hskip</code> 's around vertical rules.	
23 <code>\xdef\@tempc{\ifx\extrarowheight\HH@undef\hskip-.5\arrayrulewidth\fi}%</code>	

Now expand the *-forms and add dummy tokens (`\relax` and ‘) to either end of the token list. Call `\HH@let` to start processing the token list.

```
24 \HH@xexpast\relax#1*0x@@\toks{}\\expandafter\HH@let@\tempa'
```

`\HH@let` Discard the last token, look at the next one.

```
25 \def\HH@let#1{\futurelet@\tempb\HH@loop}
```

`\HH@loop` The main loop. Note we use `\ifx` rather than `\if` in version 2 as the new token `~` is active.

```
26 \def\HH@loop{%
```

If next token is ‘, stop the loop and put the lines into this row of the alignment.

```
27 \ifx@\tempb`\\def\next##1{\the\toks@\cr}\else\let\next\HH@let
```

|, add a vertical rule (across either a double or single hline).

```
28 \ifx@\tempb|\if@tempswa\HH@add{\hskip\doublerulesep}\fi\\@tempswatrue  
29 \HH@add{\@tempc\vline@\tempc}\else
```

: , add a broken vertical rule (across a double hline).

```
30 \ifx@\tempb:\\if@tempswa\HH@add{\hskip\doublerulesep}\fi\\@tempswatrue  
31 \HH@add{\@tempc\H@box\arrayrulewidth\arrayrulewidth@\tempc}\else
```

#, add a double hline segment between two vlines.

```
32 \ifx@\tempb##\if@tempswa\HH@add{\hskip\doublerulesep}\fi\\@tempswatrue  
33 \HH@add{\@tempc\vline@\tempc\copy@ne@\tempc\vline@\tempc}\else
```

~, A column with no hline (this gives an effect similar to `\cline`).

```
34 \ifx@\tempb`\\@tempswafalse  
35 \if@firststamp\\@firststampfalse\else\HH@add{\&\omit}\fi  
36 \HH@add{\hfil}\else
```

- , add a single hline across the column.

```
37 \ifx@\tempb-\\@tempswafalse  
38 \if@firststamp\\@firststampfalse\else\HH@add{\&\omit}\fi  
39 \HH@add{\leaders\hrule@height\arrayrulewidth\hfil}\else
```

=, add a double hline across the column.

```
40 \ifx@\tempb=\\@tempswafalse  
41 \if@firststamp\\@firststampfalse\else\HH@add{\&\omit}\fi
```

Put in as many copies of `\box1` as possible with `\leaders`, this may leave gaps at the ends, so put an extra box at each end, overlapping the `\leaders`.

```
42 \HH@add  
43 {\rlap{\copy@ne}\leaders\copy@ne\hfil\llap{\copy@ne}}\else
```

t, add the top half of a double hline segment, in a `\rlap` so that it may be used with b.

```
44 \ifx@\tempb t\HH@add{\rlap{\H@box\doublerulesep\z0}}\else
```

b, add the bottom half of a double hline segment in a `\rlap` so that it may be used with t.

```
45 \ifx@\tempb b\HH@add{\rlap{\H@box\z@\\doublerulesep}}\else
```

Otherwise ignore the token, with a warning.

```
46 \PackageWarning{hhline}{%  
47 {\meaning@\tempb\\space ignored in \\noexpand\\hhline argument%  
48 \MessageBreak}}%  
49 \fi\fi\fi\fi\fi\fi\fi
```

Go around the loop again.

```
50 \next}
```

```
51 </package>
```
