

The `tocloft` package*

Author: Peter Wilson, Herries Press

Maintainer: Will Robertson

`will dot robertson at latex-project dot org`

2009/09/04

Abstract

The `tocloft` package provides means of controlling the typographic design of the Table of Contents, List of Figures and List of Tables. New kinds of ‘List of ...’ can be defined.

The package has been tested with the `tocbind`, `minitoc`, `ccaption`, `subfigure`, `float`, `fncychap`, and `hyperref` packages.

---	-----------------------	---

1 Introduction

In the standard classes the typographic design of the Table of Contents (ToC), the List of Figures (LoF) and List of Tables (LoT) is fixed or, more precisely, it is buried within the class definitions. The `tocloft` package provides handles for an author to change the design to meet the needs of the particular document.

Elements of the package were developed as part of a class and package bundle for typesetting ISO standards [Wil96b]. This manual is typeset according to the conventions of the \LaTeX DOCSTRIP utility which enables the automatic extraction of the \LaTeX macro source files [GMS94].

Section 2 describes the usage of the package. Commented source code for the package is in Section 3.

The package has been tested in combination with at least the `tocbind` package [Wil00], the `minitoc` package [Dru99], the `ccaption` package [Wil01], the `subfigure` package [Coc95] (versions 2.0 and 2.1), the `algorithm` package [Wil96a] (which, in turn, calls the `float` package [Lin95]) and the `fncychap` package [Lin97]. It also works with the `hyperref` package. Please send me any comments as to how you think that the package can be improved, or of any interesting examples of how you have used it.¹

1.1 \LaTeX 's methods

This is a general description of how \LaTeX does the processing for a Table of Contents. As the processing for List of Figures and List of Tables is similar I will, without loss of generality, just discuss the ToC.

`\addcontentsline` \LaTeX generates a `.toc` file if the document contains a `\tableofcontents` command. The sectioning commands² put entries into the `.toc` file by calling the \LaTeX `\addcontentsline{<file>}{<kind>}{<title>}` command, where `<file>` is the file extension (e.g., `toc`), `<kind>` is the kind of entry (e.g., `section` or `subsection`), and `<title>` is the (numbered) title text. In the cases where there is a number, the `<title>` argument is given in the form `{\numberline{number} title-text}`.

NOTE: The `hyperref` package dislikes authors using `\addcontentsline`. To get it to work properly with `hyperref` you normally have to put `\phantomsection` (a macro defined within the `hyperref` package) immediately before `\addcontentsline`.

`\contentsline` The `\addcontentsline` command writes an entry to the given file in the form `\contentsline{<kind>}{<title>}{<page>}` where `<page>` is the page number. For each `<kind>`, \LaTeX provides a command `\l@kind{<title>}{<page>}` which performs the actual typesetting of the `\contentsline` entry.

`\@pnumwidth` The general layout of a typeset entry is illustrated in Figure 1. There are three

`\@tocrmarg`
`\@dotsep`
¹Thanks to Rowland (rebecca@astrid.u-net.com), John Foster (john@isjf.demon.co.uk), Kasper (kgb@dkik.dk), Lee Nave (nave@math.washington.edu), and Andrew Thurber

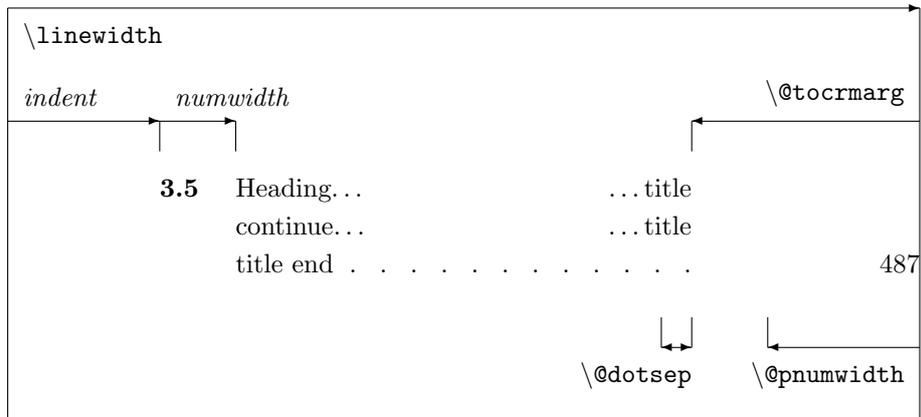

Figure 1: Layout of a ToC (LoF, LoT) entry

internal L^AT_EX commands that are used in the typesetting. The page number is typeset flushright in a box of width `\@pnumwidth`, and the box is at the righthand margin. If the page number is too long to fit into the box it will stick out into the righthand margin. The title text is indented from the righthand margin by an amount given by `\@tocrmarg`. Note that `\@tocrmarg` should be greater than `\@pnumwidth`. Some entries are typeset with a dotted leader between the end of the title text and the righthand margin indentation. The distance, in *math units*³ between the dots in the leader is given by the value of `\@dotsep`. In the standard classes the same values are used for the ToC, LoF and the LoT.

The standard values for these internal commands are:

- `\@pnumwidth = 1.55em`
- `\@tocrmarg = 2.55em`
- `\@dotsep = 4.5`

The values can be changed by using `\renewcommand`, in spite of the fact that the first two appear to be lengths.

Dotted leaders are not available for Part and Chapter ToC entries (nor for Section entries in the `article` class and its derivatives).

`\numberline`

Each `\l@kind` macro is responsible for setting the general *indent* from the lefthand margin, and the *numwidth*. The `\numberline{<number>}` macro is responsible for typesetting the number flushleft in a box of width *numwidth*. If the number is too long for the box then it will protrude into the title text. The title text is indented by $(indent + numwidth)$ from the lefthand margin. That is, the title text is typeset in a block of width $(\linewidth - indent - numwidth - \@tocrmarg)$.

(athurber@emba.uvm.edu) for their suggestions.

²For figures and tables it is the `\caption` command that populates the `.lof` and `.lot` files.

³There are 18mu to 1em.

Table 1: Indents and Numwidths (in ems)

Entry	Level	Chaptered		Otherwise	
		indent	numwidth	indent	numwidth
part	-1	0	—	0	—
chapter	0	0	1.5		
section	1	1.5	2.3	0	1.5
subsection	2	3.8	3.2	1.5	2.3
subsubsection	3	7.0	4.1	3.8	3.2
paragraph	4	10.0	5.0	7.0	4.1
subparagraph	5	12.0	6.0	10.0	5.0
figure/table	(1)	1.5	2.3	1.5	2.3

Table 1 lists the standard values for the *indent* and *numwidth*. There is no explicit *numwidth* for a part; instead a gap of 1em is put between the number and the title text. Note that for a sectioning command the values depend on whether or not the document class provides the `\chapter` command. Also, which somewhat surprises me, the table and figure entries are all indented.

`\@dottedtocline`

Most of the `\l@kind` commands are defined in terms of the `\@dottedtocline` command. This command takes three arguments:

```
\@dottedtocline{<secllevel>}{<indent>}{<numwidth>}
```

For example, one definition of the `\l@section` command is:

```
\newcommand*{\l@section}{\@dottedtocline{1}{1.5em}{2.3em}}
```

If it is necessary to change the default typesetting of the entries, then it is usually necessary to change these definitions (but the `tocloft` package gives you handles to easily alter things without having to know the \LaTeX internals).

You can use the `\addcontentsline` command to add `\contentsline` commands to a file.

`\addtocontents`

\LaTeX also provides the `\addtocontents{<file>}{<text>}` command that will insert `<text>` into `<file>`. You can use this for adding extra text and/or macros into the file, for processing when the file is typeset by `\tableofcontents` (or whatever other command is used for `<file>` processing, such as `\listoftables` for a `.lot` file).

As `\addcontentsline` and `\addtocontents` write their arguments to a file, any fragile commands used in their arguments must be `\protected`.

You can make certain adjustments to the ToC etc., layout without using any package. Some examples are:

- If your page numbers stick out into the righthand margin

```
\renewcommand{\@pnumwidth}{3em} \renewcommand{\@tocrmarg}{4em}
```

but using lengths appropriate to your document.

- To have the (sectional) titles in the ToC, etc., typeset ragged right with no hyphenation

```
\renewcommand{\@tocrmarg}{2.55em plus1fil}
```

where the value 2.55em can be changed for whatever margin space you want.

- The dots in the leaders can be eliminated by increasing \@dotsep to a large value:

```
\renewcommand{\@dotsep}{10000}
```

- To have dotted leaders in your ToC and LoF but not in your LoT:

```
...
\tableofcontents
\makeatletter \renewcommand{\@dotsep}{10000} \makeatother
\listoftables
\makeatletter \renewcommand{\@dotsep}{4.5} \makeatother
\listoffigures
...
```

For this document I used this method to double the dot spacing for the LoF with respect to that for the ToC. As you can see, it is much better that all dot leaders have the same spacing.

- To add a horizontal line across the whole width of the ToC below an entry for a Part:

```
\part{Part title}
\addtocontents{toc}{\protect\mbox{}\protect\hrulefill\par}
```

Note that as both \addtocontents and \addcontentsline write their arguments to a file, it means that any *fragile* commands in their arguments must be protected by preceding each fragile command with \protect. The result of the example above would be the following two lines in the .toc file (assuming that it is the second Part and is on page 34):

```
\contentsline {part}{II\hspace {1em}Part title}{34}
\mbox {}\hrulefill \par
```

If the \protects were not used, then the second line would instead be:

```
\unhbox \voidb@x \hbox {} \unhbox \voidb@x \leaders \hrule \hfill \kern \z@ \par
```

- You may get undesired page breaks in the ToC. For example you may have a long multiline section title and in the ToC there is a page break between the lines. After your document is stable you can use `\addtocontents` at appropriate places in the body of the document to adjust the page breaking in the ToC. As examples:
 - `\addtocontents{toc}{\protect\newpage}` to force a page break.
 - `\addtocontents{toc}{\protect\enlargethispage{2\baselineskip}}` to make the page longer.
 - `\addtocontents{toc}{\protect\negspace{2\baselineskip}}` to specify that if there is not a vertical space of two baselines left on the page then start a new page (the `\negspace` macro is defined in the `negspace` package).

Remember, if you are modifying any command that includes an @ sign then this must be done in either a `.sty` file or if in the document itself it must be surrounded by `\makeatletter` and `\makeatother`. For example, if you want to modify `\@dotsep` in the preamble to your document you have to do it like this:

```
\makeatletter
\renewcommand{\@dotsep}{9.0}
\makeatother
```

2 The `tocloft` package

The `tocloft` package provides means of specifying the typography of the Table of Contents (ToC), the List of Figures (LoF) and the List of Tables (LoT).

`\tableofcontents`
`\listoffigures`
`\listoftables`

The ToC, LoF, and LoT are printed at the point in the document where these commands are called, as per normal L^AT_EX. However, there is one difference between the standard L^AT_EX behaviour and the behaviour with the `tocloft` package. In the standard L^AT_EX classes that have `\chapter` headings, the ToC, LoF and LoT each appear on a new page. With the `tocloft` package they do not necessarily start new pages; if you want them to be on new pages you may have to specifically issue an appropriate command beforehand. For example:

```
...
\clearpage
\tableofcontents
\clearpage
\listoftables
...
```

`\tocloftpagestyle`

The `\thispagestyle` page style of the ToC, LoF and/or LoT is set by the command `\tocloftpagestyle{<style>}`, where `<style>` is one of the available page styles. The package initially sets `\tocloftpagestyle{plain}`.

2.1 Package options

The package takes the following options:

- `subfigure` This option is required if, and only if, the `tocloft` and `subfigure` packages are being used together. The two packages can be specified in any order.
- `titles` The `titles` option causes the titles of the ToC, LoF, and LoT lists to be typeset using the default L^AT_EX methods. This can be useful, for example, when the `tocloft` and `fncychap` packages are used together and the ‘fancy’ chapter styles should be used for the ToC, etc., titles.

If you use the `titles` option you can ignore the next section and continue reading at section 2.3.

2.2 Changing the titles

Commands are provided for controlling the appearance of the titles. Following L^AT_EX custom, the title texts are the values of the `\contentsname`, `\listfigurename` and `\listtablename` commands.

Similar sets of commands are provided for ToC, LoF and LoT title typesetting control. For convenience (certainly mine, and hopefully yours) in the following descriptions I will use Z to stand for ‘toc’ or ‘lof’ or ‘lot’. For example, `\cftmarkZ` stands for `\cftmarktoc` or `\cftmarklof` or `\cftmarklot`.

`\cftmarkZ` These macros set the appearance of the running heads on the ToC, LoF, and LoT pages. You probably don’t need to change these.

`\cftbeforeZtitleskip` These lengths control the vertical spacing before and after the titles. You can change them from their default values by using `\setlength`.

`\cftafterZtitleskip` The code used for typesetting the ToC title looks like

```
\cfttoctitlefont \contentsname{\cftaftertoctitle}\par
```

`\cftZtitlefont`

`\cftafterZtitle`

By default, `\cftZtitlefont` is defined as a font specification (e.g., `\Large\bfseries`), and `\cftafterZtitle` is empty. These commands can be changed (via `\renewcommand`) to change the typesetting. As examples:

- `\renewcommand{\cftZtitlefont}{\hfill\Large\itshape}` will result in a Large italic title typeset flushright.
- `\renewcommand{\cftZtitlefont}{\hfill\Large\bfseries}` together with `\renewcommand{\cftafterZtitle}{\hfill}` will give a centered Large bold title.
- Doing

```
\renewcommand{\cftafterZtitle}{%
  \\\[\baselineskip]\mbox{} \hfill{\normalfont Page}}
```

will put the word ‘Page’ flushright on the line following the title. (If you do this, then you may need to decrease `\cftafterZtitleskip`).

- `\renewcommand{\cftafterZtitle}{\thispagestyle{empty}}` will make the page with the title empty (i.e., the page number will not be printed).

2.3 Typesetting the entries

Commands are also provided to enable finer control over the typesetting of the different kinds of entries. The parameters defining the default layout of the entries are illustrated as part of the `layouts` package or in [GMS94, page 34], and are repeated in Figure 1.

`\cftdot` In the default ToC typesetting only the more minor entries have dotted leader lines between the sectioning title and the page number. The `tocloft` package provides for general leaders for all entries. The ‘dot’ in a leader is given by the value of `\cftdot`. Its default definition is `\newcommand{\cftdot}{.}` which gives the default dotted leader. By changing `\cftdot` you can use symbols other than a period in the leader. For example

```
\renewcommand{\cftdot}{\ensuremath{\ast}}
```

will result in a dotted leader using asterisks as the symbol.

`\cftdotsep` Each kind of entry can control the separation between the dots in its leader
`\cftnodots` (see below). For consistency though, all dotted leaders should use the same spacing. The macro `\cftdotsep` specifies the default spacing. Its value is a number. However, if the separation is too large then no dots will be actually typeset. The macro `\cftnodots` is a separation value that is ‘too large’.

`\cftsetpnumwidth` The page numbers are typeset in a fixed width box. The command
`\cftsetrmarg` `\cftsetpnumwidth{<length>}` can be used to change the width of the box (L^AT_EX’s internal `\@pnumwidth`). The title texts will end before reaching the righthand margin. `\cftsetrmarg{<length>}` can be used to set this distance (L^AT_EX’s internal `\@tocrmarg`). Note that the length used in `\cftsetrmarg` should be greater than the length set in `\cftsetpnumwidth`. These values should remain constant in any given document.

`\cftparskip` Normally the `\parskip` in the ToC, etc., is zero. This may be changed by changing the `\cftparskip` length. Note that the current value of `\cftparskip` is used for the ToC, LoF and LoT, but you can change the value before calling `\tableofcontents` or `\listoffigures` or `\listoftables` if one or other of these should have different values (which is not a good idea).

In the following I will use *X* to stand for the following:

- `part` for `\part` titles
- `chap` for `\chapter` titles
- `sec` for `\section` titles
- `subsec` for `\subsection` titles

- `subsubsec` for `\subsubsection` titles
- `para` for `\paragraph` titles
- `subpara` for `\subparagraph` titles
- `fig` for figure `\caption` titles
- `subfig` for subfigure `\caption` titles
- `tab` for table `\caption` titles
- `subtab` for subtable `\caption` titles

`\cftbeforeXskip` This controls the vertical space before an entry. It can be changed by using `\setlength`.

`\cftXindent` This controls the indentation of an entry from the left margin (*indent* in Figure 1). It can be changed using `\setlength`.

`\cftXnumwidth` This controls the space allowed for typesetting title numbers (*numwidth* in Figure 1). It can be changed using `\setlength`. Second and subsequent lines of a multiline title will be indented by this amount.

The remaining commands are related to the specifics of typesetting an entry. This is a simplified pseudo-code version for the typesetting of numbered and unnumbered entries.

```
{\cftXfont {\cftXpresnum SNUM\cftXaftersnum\hfil} \cftXaftersnum TITLE}%
  {\cftXleader}{\cftXpagefont PAGE}\cftXafterpnum\par
```

```
{\cftXfont TITLE}{\cftXleader}{\cftXpagefont PAGE}\cftXafterpnum\par
```

where `SNUM` is the section number, `TITLE` is the title text and `PAGE` is the page number. In the numbered entry the pseudo-code `{\cftXpresnum SNUM\cftXaftersnum\hfil}` is typeset within a box of width `\cftXnumwidth`.

`\cftXfont` This controls the appearance of the title (and its preceding number, if any). It may be changed using `\renewcommand`.

`\cftXpresnum` Normally the section number is typeset within a box of width `\cftXnumwidth`.
`\cftXaftersnum` Within the box the macro `\cftXpresnum` is first called, then the number is typeset, and next the `\cftXaftersnum` macro is called after the number is typeset. The
`\cftXaftersnumb` last command within the box is `\hfil` to make the box contents flushleft. After the box is typeset the `\cftXaftersnumb` macro is called before typesetting the title text. All three of these can be changed by `\renewcommand`. By default they are defined to do nothing.

In the standard classes the ToC entry for a `\part` is just typeset as the number and title, followed by the page number, with the `\cftpartpresnum` macro being called before typesetting the number and title. When a standard class is used the `\cftpartaftersnum` and `\cftpartaftersnumb` macros have no effect, but they may do something if a non-standard class is used.

`\cftXleader` `\cftXleader` defines the leader between the title and the page number; it can be changed by `\renewcommand`. The spacing between any dots in the leader is controlled by `\cftXdotsep` (`\@dotsep` in Figure 1). It can be changed by `\renewcommand` and its value must be either a number (e.g., 6.6 or `\cftdotsep`) or `\cftnodots` (to disable the dots). The spacing is in terms of *math units* where there are 18mu to 1em.

`\cftXpagefont` This defines the font to be used for typesetting the page number. It can be changed by `\renewcommand`.

`\cftXafterpnum` This macro is called after the page number has been typeset. Its default is to do nothing. It can be changed by `\renewcommand`.

`\cftsetindents` The command `\cftsetindents{⟨entry⟩}{⟨indent⟩}{⟨numwidth⟩}` sets the *⟨entry⟩*'s *indent* to the length *⟨indent⟩* and its *numwidth* to the length *⟨numwidth⟩*. The *⟨entry⟩* argument is the name of one of the standard entries (e.g., `subsection`) or the name of entry that has been defined with the `tocloft` package. For example `\cftsetindents{figure}{0em}{1.5em}` will make figure entries left justified.

Various effects can be achieved by changing the definitions of `\cftXfont`, `\cftXaftersnum`, `\cftXaftersnumb`, `\cftXleader` and `\cftXafterpnum`, either singly or in combination. For the sake of some examples, assume that we have the following initial definitions

```

\newcommand{\cftXfont}{}
\newcommand{\cftXaftersnum}{}
\newcommand{\cftXaftersnumb}{}
\newcommand{\cftXleader}{\cftdotfill{\cftXdotsep}}
\newcommand{\cftXdotsep}{\cftdotsep}
\newcommand{\cftXpagefont}{}
\newcommand{\cftXafterpnum}{}

```

(Note that the same font should be used for the title, leader and page number to provide a coherent appearance).

- To eliminate the dots in the leader:

```
\renewcommand{\cftXdotsep}{\cftnodots}
```

- To put something (e.g., a name) before the title (number):

```
\renewcommand{\cftXpresnum}{SOMETHING }
```

- To add a colon after the section number:

```
\renewcommand{\cftXaftersnum}{:}
```

- To put something before the title number, add a colon after the the title number, set everything in bold font, and start the title text on the following line:

```

\renewcommand{\cftXfont}{\bfseries}
\renewcommand{\cftXleader}{\bfseries\cftdotfill{\cftXdotsep}}
\renewcommand{\cftXpagefont}{\bfseries}
\renewcommand{\cftXpresnum}{SOMETHING }
\renewcommand{\cftXaftersnum}{:}
\renewcommand{\cftXaftersnumb}{\}

```

If you are adding text in the number box in addition to the number, then you will probably have to increase the width of the box so that multiline titles have a neat vertical alignment; changing box widths usually implies that the indents will require modification as well.⁴ One possible method of adjusting the box width for the above example is:

```

\newlength{\mylen} % a "scratch" length
\settowidth{\mylen}{\bfseries\cftXpresnum\cftXaftersnum} % extra space
\addtolength{\cftXnumwidth}{\mylen} % add the extra space

```

- To set the section numbers flushright:⁵

```

\setlength{\mylen}{0.5em} % need some extra space at end of number
\renewcommand{\cftXpresnum}{\hfill} % note the double 'l'
\renewcommand{\cftXaftersnum}{\hspace*{\mylen}}
\addtolength{\cftXnumwidth}{\mylen}

```

In the above, the added initial `\hfill` in the box overrides the final `\hfil` in the box, thus shifting everything to the right hand end of the box. The extra space is so that the number is not typeset immediately at the left of the title text.

- To set the entry ragged left (but this only looks good for single line titles):

```

\renewcommand{\cftXfont}{\hfill\bfseries}
\renewcommand{\cftXleader}{}

```

- To set the page number immediately after the entry text instead of at the righthand margin:

```

\renewcommand{\cftXleader}{}
\renewcommand{\cftXafterpnum}{\cftparfillskip}

```

⁴Lyndon Dudding (lyndon.dudding@totalise.co.uk) discovered this.

⁵With thanks to David Holz (lbda@earthlink.net) for requesting this.

By default the `\parfillskip` value is locally set to fill up the last line of a paragraph. Just changing `\cftXleader` puts horrible interword spaces into the last line of the title. The `\cftparfillskip` command is part of the `tocloft` package and is provided just so that the above effect can be achieved.

`\cftpagenumbersoff` The command `\cftpagenumbersoff{⟨entry⟩}` will eliminate the page numbers for `⟨entry⟩` in the listing, where `⟨entry⟩` is the name of one of the standard kinds of entries (e.g., `subsection`, or `figure` — including `subfigure` if the `subfigure` package is used — etc.), or the name of a new entry defined with the `tocloft` package.

`\cftpagenumberon`

The command `\cftpagenumberon{⟨entry⟩}` reverses the effect of a corresponding `\cftpagenumbersoff`.

One question that appeared on the `comp.text.tex` newsgroup asked how to get the titles of Appendices list in the ToC *without* page numbers. Here is a simple way of doing it, assuming the document has chapters

```
...
\appendix
\addtocontents{toc}{\cftpagenumbersoff{chapter}}
\chapter{First appendix}
```

If there are other chaptered headings to go into the ToC after the appendices, then it will be necessary to do a similar

```
\addtocontents{toc}{\cftpagenumberon{chapter}}
```

to restore the page numbering in the ToC.

Similarly, if you are using the `subfigure` package you may want to eliminate the page numbers for the subfigure captions. This can be accomplished by:

```
\cftpagenumbersoff{subfigure}
```

At this point, I leave it up to your ingenuity as to other effects that you can achieve. However, if you come up with further examples, let me know for possible inclusion in a later version of this document.

2.4 New list of...

`\newlistof` The command `\newlistof[⟨within⟩]{⟨entry⟩}{⟨ext⟩}{⟨listofname⟩}` creates a new List of ..., and assorted commands to go along with it.

The first required argument, `⟨entry⟩` is used to define a new counter called `entry`. The optional `⟨within⟩` argument can be used so that `entry` gets reset to one every time the counter called `within` is changed. That is, the first two arguments are equivalent to calling `\newcounter{⟨entry⟩}[⟨within⟩]`.

The next argument, `⟨ext⟩`, is the file extension for the new List of. The last argument, `⟨listofname⟩`, is the text for the heading of the new List of. As an example:

```
\newcommand{\listanswername}{List of Answers}
\newlistof[chapter]{answer}{ans}{\listanswername}
```

will create a new `answer` counter that will be reset at the start of each `\chapter{...}`. Any answer titles will be written to the file `jobname.ans` and `\listanswername` will be used as the list heading. A command `\listofanswer` is created which can be used just like the `\listoftables` or `tableofcontents` commands to generate a listing. It is up to you to specify how the entries are put into the new List of Answers. Here is a very simple example, remembering that an `answer` counter has been created.

```
\newcommand{\answer}[1]{%
  \refstepcounter{answer}
  \par\noindent\textbf{Answer \theanswer. #1}
  \addcontentsline{ans}{answer}{\protect\numberline{\theanswer}#1}\par}
```

which, when used like:

```
\answer{Hard} The \ldots will print as:
```

Answer 1. Hard

The ...

As mentioned above, the `\newlistof` command creates several new commands, most of which you should now be familiar with. For convenience, assume that `\newlistof{X}{Z}{...}` has been issued; so `X` is the name of the new counter and corresponds to the `X` in section 2.3, and `Z` is the new file extension and corresponds to the `Z` in section 2.2. Then, among others, the following new commands will be made available.

The five commands, `\cftmarkZ`, `\cftbeforeZtitleskip`, `\cftafterZtitleskip`, `\cftZtitlefont`, and `\cftafterZtitle`, are analagous to the commands of the same names described in section 2.2.

`\listofX` The command `\listofX` is similar to `\listoftables`, etc., in that it typesets the new listing at the point where it is called.

`\Zdepth` The command `\Zdepth{<number>}` is analagous to the standard `\tocdepth{<number>}` command, in that it specifies that entries in the new listing should not be typeset if their numbering level is greater than `<number>`. The default definition is `\setcounter{Zdepth}{1}`.

`\newlistentry` The command `\newlistentry[<within>]{<entry>}{<ext>}{<level-1>}` creates new commands for typesetting a new kind of entry in a listing. It is used internally by the `\newlistof` command but may be used independently.

The first required argument, `<entry>` is used to define a new counter called `entry`. The optional `<within>` argument can be used so that `entry` gets reset to one every time the counter called `within` is changed. That is, the first two arguments are equivalent to calling `\newcounter{<entry>}[<within>]`. The second required argument, `<ext>`, is the file extension for the entry listing. The last argument, `<level-1>`, is a number specifying the numbering level minus one, of the entry in a listing. For example, the command

```
\newlistof[chapter]{answer}{ans}{\listanswername}
```

will call the command:

```
\newlistentry[chapter]{answer}{ans}{0}
```

Calling `\newlistentry` creates several new commands. Assuming that it is called as `\newlistentry[within]{X}{Z}{N}`, where X and Z are similar to the previous uses of them, and N is an integer number, then the following commands are made available.

The set of commands `\cftbeforeXskip`, `\cftXfont`, `\cftXpresnum`, `\cftXaftersnum`, `\cftXaftersnumb`, `\cftXleader`, `\cftXdotsep`, `\cftXpagefont`, and `\cftXafterpnum`, are analagous to the commands of the same names described in section 2.3. Their default values are also as described earlier.

The default values of `\cftXindent` and `\cftXnumwidth` are set according to the value of the $\langle level-1 \rangle$ argument (i.e., N in this example). For N=0 the settings correspond to those for sections in non-chaptered documents, as listed in Table 1. For N=4 the settings correspond to subparagraphs in non-chaptered documents, and for intermediate values correspond to the matching sectional division in chaptered documents. For values of N less than zero or greater than four, or for non-default values, use the `\cftsetindents` command to set the values.

`\l@X` `\l@X` is an internal command that typesets an entry in the list, and is defined in terms of the above `\cft*X*` commands. It will not typeset an entry if `\Zdepth` is N or less, where Z is the listing's file extension.

`\theX` The command `\theX` prints the value of the X counter. It is initially defined so that it prints arabic numerals. If the optional $\langle within \rangle$ argument is used, `\theX` is defined as

```
\renewcommand{\theX}{\thewithin.\arabic{X}} otherwise as
\renewcommand{\theX}{\arabic{X}}.
```

As an example of the independent use of `\newlistentry`, the following will set up for sub-answers.

```
\newlistentry[answer]{subanswer}{1}
\cftsetindents{subanswer}{1.5em}{3.0em}
\renewcommand{\thesubanswer}{\theanswer.\alph{subanswer}}
\newcommand{\subanswer}[1]{%
  \refstepcounter{subanswer}
  \par\textbf{\thesubanswer} #1}
\addcontentsline{ans}{subanswer{\protect\numberline{\thesubanswer}#1}}
\setcounter{ansdepth}{2}
```

And then:

```
\answer{Harder} The \ldots
\subanswer{Reformulate the problem} It assists \ldots
```

will be typeset as:

Answer 2. Harder

The ...

2.a) Reformulate the problem It assists ...

By default the answer entries will appear in the List of Answers listing (typeset by the `\listofanswer` command). In order to get the subanswers to appear, the `\setcounter{ansdepth}{2}` command was used above.

To turn off page numbering for the subanswers, do
`\cftpagenumbersoff{subanswer}`

As another example of `\newlistentry`, suppose that an extra sectioning division below `subparagraph` is required, called `subsubpara`. The `\subsubpara` command itself can be defined via the LaTeX kernel `\@startsection` command. Also it is necessary to define a `\subsubparamark` macro, a new `subsubpara` counter, a `\thesubsubpara` macro and a `\l@subsubpara` macro. Using the `tocloft` package's `\newlistentry` takes care of most of these as shown below (remember the caveats about commands with @ signs in them).

```
\newcommand{\subsubpara}{\@startsection{subpara}%
  {6}%                                level
  {\parindent}%                        indent from left margin
  {3.25ex \@plus1ex \@minus .2ex}%    skip above heading
  {-1em}%                               runin heading with 1em between title & text
  {\normalfont\normalsize\itshape}%   italic number and title
}
\newlistentry[subparagraph]{subsubpara}{toc}{5}
\cftsetindents{subsubpara}{14.0em}{7.0em}
\newcommand*{\subsubparamark}[1]{ }    % gobble heading mark
```

Each List of . . . uses a file to store the list entries, and these files must remain open for writing throughout the document processing. TeX has only a limited number of files that it can keep open, and this puts a limit on the number of listings that can be used. For a document that includes a ToC but no other extra ancillary files (e.g., no index or bibliography output files) the maximum number of LoX's, including a LoF and LoT, is no more than about eleven. If you try and create too many new listings LaTeX will respond with the error message:

No room for a new write

If you get such a message the only recourse is to redesign your document.

The `tocloft` package does not provide a simple means of specifying new Lists of Floats or float environments. For those, I recommend the `ccaption` package [Wil01].

2.5 Experimental utilities

The macros described in this section are even more experimental than those described previously.

`\cftchapterprecis` Some old style novels, and even some modern text books,⁶ include a short synopsis of the contents of the chapter either immediately after the chapter heading or in the Toc, or in both places.

The command `\cftchapterprecis{<text>}` prints its argument both at the point in the document where it is called, and also adds it to the `.toc` file. For example:

⁶For example, Robert Sedgewick, *Algorithms*, Addison-Wesley, 1983.

```

...
\chapter{} % first chapter
\cftchapterprecis{Our hero is introduced; family tree; early days.}
...

```

`\cftchapterprecishere` The `\cftchapterprecis` command calls these two commands to print the text in the document (the `\...here{<text>}` command) and to put it into the ToC (the `\...toc{<text>}` command). These can be used individually if required.

Sometimes it may be desirable to make a change to the global parameters for an individual entry. For example, a figure might be placed on the end paper of a book (the inside of the front or back cover), and this needs to be placed in a LoF with the page number set as, say ‘inside front cover’. If ‘inside front cover’ is typeset as an ordinary page number it will stick out into the margin. Therefore, the parameters for this particular entry need to be changed.

`\cftlocalchange` The command `\cftlocalchange{<file>}{<pnumwidth>}{<tocrmarg>}` will write an entry into `<file>` to reset the global parameters. The command should be called again after any special entry to reset the parameters back to their usual values. Any fragile commands used in the arguments must be protected.

`\cftaddtitleline` The command `\cftaddtitleline{<file>}{<kind>}{<title>}{<page>}` will write a `\contentsline` entry into `<file>` for a `<kind>` entry with title `<title>` and page number `<page>`. That is, an entry is made of the form:

```
\contentsline{<kind>}{<title>}{<page>}
```

Any fragile commands used in the arguments must be protected.

`\cftaddnumtitleline` The command `\cftaddnumtitleline{<file>}{<kind>}{<num>}{<title>}{<page>}` is similar except that it also includes `<num>` as the argument to the `\numberline`.

That is, an entry is made of the form:

```
\contentsline{<kind>}{\numberline{<num> title}{<page>}
```

Any fragile commands used in the arguments must be protected.

As an example of the use of these commands, noting that the default L^AT_EX values for `\@pnumwidth` and `\@tocrmarg` are 1.55em and 2.55em respectively, one might do the following for a figure on the frontispiece page.

```

...
% this is the frontispiece page with no number
% draw or import the picture (with no \caption)
\cftlocalchange{lof}{4em}{5em} % make pnumwidth big enough for
                                % frontispiece and change margin to suit
\cftaddtitleline{lof}{figure}{The title}{frontispiece}
\cftlocalchange{lof}{1.55em}{2.55em} % return to normal settings
...

```

Recall that a `\caption` command will put an entry in the `.lof` file, which is not wanted here. If a caption is required, then you can either craft one yourself or, assuming that your general captions are not too exotic, use the `\legend` command from the `ccaption` package. If the illustration is numbered, use the `\cftaddnumtitleline` command instead of `\cftaddtitleline`.

2.6 Usage with other packages

The `tocloft` and `tocbibind` packages can be used together in the same document. The `tocbibind` package provides easy means of adding document elements like the bibliography or the index to the Table of Contents. However there are two known potential problems:

- The 1998/11/15 version of `tocbibind` may give surprising results if the `\toctocname`, `\toclotname` or `\toclofname` commands have been used. You should consider getting the current version of `tocbibind`.
- If the argument to the `\tocotherhead` command is other than one of the normal sectioning divisions (i.e., part through to sub-paragraph) such as `\tocotherhead{clause}`, then this will almost certainly cause a problem (as the `tocloft` package will not know how to define the corresponding `\l@clause` command). In such a case you will have to supply the appropriate macros yourself.

`\@cftbsnum` Some packages, like the `float` package by Anselm Lingnau, enable the creation of other kinds of *List of . . .*. The `tocloft` package is only minimally able to change the formatting of these, principally because the packages are independent of each other and, in the case of the `float` package, new kinds of float environments and their associated lists can be created on the fly at any point in a document. Some aspects of the typesetting are controlled by `\@cftbsnum`, `\@cftasnum` and `\@cftasnumb` commands. These are equivalent to the `\cftXpresnum`, `\cftXaftersnum` and `\cftXaftersnumb` commands described earlier. By default they are defined to do nothing, but may be renewed to do something.

The `tocloft` and `minitoc` packages have an unfortunate interaction,⁷ which fortunately can be fixed. In the normal course of events, when `minitoc` is used in a chaptered document it will typeset section entries in the `minitocs` in bold font. If `tocloft` is used in conjunction with `minitoc`, then the `minitoc` section entries are typeset in the normal font, except for the page numbers which are in bold font, while the ToC section entries are all in normal font.

One cure, if you want the `minitoc` section entries to be all in normal font is to put:

```
\renewcommand{\mtcSfont}{\small\normalfont}
```

in the preamble.

Otherwise, the cure is the following incantation:

```
\renewcommand{\cftsecfont}{\bfseries}
\renewcommand{\cftsecleader}{\bfseries\cftdotfill{\cftdotsep}}
\renewcommand{\cftsecpagefont}{\bfseries}
```

⁷Discovered by Lyndon Dudding (lyndon.dudding@totalise.co.uk).

To have the section entries in both the ToC and the minitocs in bold then put the incantation in the preamble. To have only the minitoc section entries in bold while the ToC entries are in the normal font, put the incantation between the `\tableofcontents` command and the first `\chapter` command.

In general, use with other packages that redefine any of the macros that `tocloft` also modifies is likely to be problematic.

3 The package code

Announce the name and version of the package, which requires L^AT_EX 2_ε but no extra packages.

```
1 \*usc
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{tocloft}[2009/09/04 v2.3d parameterised ToC, etc., typesetting]
```

`\PRWPackageNote` These two commands write a Package Note to the terminal and the log file. Use
`\PRWPackageNoteNoLine` as: `\PRWPackageNote{<package name>}{<note text>}`. The NoLine version does not show the line number. The commands are intermediate between the kernel `\PackageWarning` and `\PackageInfo` commands. I have `\provided` the `\PRW...` commands as other packages (of mine) may also incorporate them. The code is based on `lterror.dtx`.

```
4 \providecommand{\PRWPackageNote}[2]{%
5   \GenericWarning{%
6     (#1)\@spaces\@spaces\@spaces\@spaces
7   }{%
8     Package #1 Note: #2%
9   }%
10 }
11 \providecommand{\PRWPackageNoteNoLine}[2]{%
12   \PRWPackageNote{#1}{#2\@gobble}%
13 }
```

In order to try and avoid name clashes with other packages, each internal name will include the character string `@cft`.

`\@cftquit` We will be using either chapter or section type headings for the ToC, etc., so we
`\ifcfthaschapter` need to know which of these the document class supports.

```
14 \newcommand{\@cftquit}{}
15 \newif\ifcfthaschapter
```

`\ifcftkoma` The koma classes have different defaults than the standard classes, so we need to know if a koma class has been loaded.

```
16 \newif\ifcftkoma
17 \cftkomafalse
18 \@ifclassloaded{scrartcl}{\cftkomatrue}{}
19 \@ifclassloaded{scrreprt}{\cftkomatrue}{}
20 \@ifclassloaded{scrbook}{\cftkomatrue}{}
21
```

Issue a warning if there are no recognised sectional divisions and then skip the rest of the package code.

```
22 \ifundefined{chapter}{%
23   \cfthaschapterfalse
24   \ifundefined{section}{%
25     \PackageWarning{tocloft}%
26       {I don't recognize any sectional divisions so I'll do nothing}
27     \renewcommand{\@cftquit}{\endinput}
28     }\PRWPackageNoteNoLine{tocloft}{The document has section divisions}}
29   }\@cfthaschaptertrue
30   \PRWPackageNoteNoLine{tocloft}{The document has chapter divisions}}
```

Perhaps quit now.

```
31 \@cftquit
```

Use chapter style if `\ifcfthaschapter` is TRUE, otherwise section style.

`\ifcfttocbibind` A flag that is set TRUE iff the `tocbibind` package has been loaded. The 1998/11/15 version of `tocbibind` does not necessarily work well with `tocloft`.

```
32 \newif\ifcfttocbibind
33 \AtBeginDocument{%
34   \ifpackageloaded{tocbibind}{\@cfttocbibindtrue}{\@cfttocbibindfalse}
35   \ifcfttocbibind
36     \ifpackagelater{tocbibind}{1998/11/16}{%
37       \PackageWarning{tocloft}{%
38 You are using a version of the tocbibind package\MessageBreak
39 that is not compatible with tocloft.\MessageBreak
40 The results may be surprising.\MessageBreak
41 Consider installing the current version of tocbibind.}}
42   \fi
43 }
```

`\ifcftnctoc` A boolean used to implement the `titles` option. It is TRUE if the ToC, LoT, LoF titles should use the default styles.

```
44 \newif\ifcftnctoc\@cftnctocfalse
45 \DeclareOption{titles}{\@cftnctoctrue}
46 %% \ProcessOptions\relax
```

`\ifcftsubfigopt` A boolean used to implement the `subfigure` option.

```
47 \newif\ifcftsubfigopt\@cftsubfigoptfalse
48 \DeclareOption{subfigure}{\@cftsubfigopttrue}
```

Process the options.

```
49
50 \ProcessOptions\relax
51
```

`\tocloftpagestyle` A user-level macro to set the pagestyle for the first page of the ToC, etc. The `\cftpagestyle` default is the plain pagestyle.

```

52 \newcommand{\tocloftpagestyle}[1]{%
53   \def\@cftpagestyle{\thispagestyle{#1}}}
54 \tocloftpagestyle{plain}
55
\cftmarktoc These three macros set the style for running heads. They are initialised to give
\cftmarklof the default appearance.
\cftmarklot
56 \newcommand{\cftmarktoc}{%
57   \@mkboth{\MakeUppercase\contentsname}{\MakeUppercase\contentsname}}
58 \newcommand{\cftmarklof}{%
59   \@mkboth{\MakeUppercase\listfigurename}{\MakeUppercase\listfigurename}}
60 \newcommand{\cftmarklot}{%
61   \@mkboth{\MakeUppercase\listtablename}{\MakeUppercase\listtablename}}
62 \if@cfkoma
63   \renewcommand{\cftmarktoc}{%
64     \@mkboth{\contentsname}{\contentsname}}
65   \renewcommand{\cftmarklof}{%
66     \@mkboth{\listfigurename}{\listfigurename}}
67   \renewcommand{\cftmarklot}{%
68     \@mkboth{\listtablename}{\listtablename}}
69 \fi

\@cfttocstart Two macros to perform the actions at the beginning and end of the \tableofcontents
\@cfttocfinish command (and friends). \@cfttocstart deals with chaptered documents, ensuring
that the ToC is typeset in a single column (see classes.dtx for the original
code). These macros are also provided by the ccaption package.
70 \providecommand{\@cfttocstart}{%
71   \if@cfthaschapter
72     \if@twocolumn
73       \@restonecoltrue\onecolumn
74     \else
75       \@restonecolfalse
76     \fi
77   \fi}

\@cfttocfinish resets, if required, twocolumn typesetting.
78 \providecommand{\@cfttocfinish}{%
79   \if@cfthaschapter
80     \if@restonecol\twocolumn\fi
81   \fi}

\phantomsection This is provided because the hyperref package screws with \addcontentsline.
82 \providecommand{\phantomsection}{}
83

\@cftdobibtoc If the tocbind package has been used and it has redefined \tableofcontents we
need to cater for that. The contents of the definition are defined in tocbibind.
84 \newcommand{\@cftdobibtoc}{%
85   \if@dotoc

```

```

86   \if@bibchapter
87     \phantomsection
88     \addcontentsline{toc}{chapter}{\contentsname}
89   \else
90     \phantomsection
91     \addcontentsline{toc}{\@tocextra}{\contentsname}
92   \fi
93 \fi}
94

```

`\cftparskip` The `\parskip` local to the ToC, etc., is set to the length `\cftparskip`.

```

95 \newlength{\cftparskip}
96 \setlength{\cftparskip}{0pt}
97

```

`\tableofcontents` This is a parameterised version of the default `\tableofcontents` command. Each class has its own definition, but we have to cater for all classes in one definition, hence some of the checks. The definition is modified after all packages have been loaded.

If the titles option has been used, then the command is not modified.

```

98 \AtBeginDocument{%
99 \if@cftnctoc\else
100 \renewcommand{\tableofcontents}{%
101   \cfttocstart

```

Ensure that any previous paragraph has been finished. Within a group set the local paragraphing style and typeset the title.

```

102   \par
103   \begingroup
104     \parindent\z@ \parskip\cftparskip
105     \@cftmaketoctitle

```

If `tocbibind` has been used, then add the ToC name to the ToC.

```

106     \if@cfttocbibind
107       \cftdobibtoc
108     \fi

```

Finally, read the `.toc` file and finish up.

```

109     \@starttoc{toc}%
110   \endgroup
111   \@cfttocfinish}
112 \fi
113 }

```

`\@cftmaketoctitle` This command typesets the title for the ToC.

```

114 \newcommand{\@cftmaketoctitle}{%
115   \addpenalty\@secpenalty
116   \if@cfthaschapter
117     \vspace*{\cftbeforetoctitleskip}
118   \else

```

```

119   \vspace{\cftbeforetoctitleskip}
120   \fi
121   \@cftpagestyle
122   {\interlinepenalty\@M
123   {\cfttoctitlefont\contentsname}{\cftaftertocitle}
124   \cftmarktoc
125   \par\nobreak
126   \vskip \cftaftertocitleskip
127   \@afterheading}}

```

`\cftbeforetoctitleskip` These two lengths control the vertical spacing before and after the ToC title.

`\cftaftertocitleskip` 128 `\newlength{\cftbeforetoctitleskip}`
129 `\newlength{\cftaftertocitleskip}`

Their values depend on whether the document has chapters or not. In chaptered documents the default ToC title is typeset as a `\chapter*`, otherwise as a `\section*`.

```

130 \if@cfthaschapter
131   \setlength{\cftbeforetoctitleskip}{50pt}
132   \setlength{\cftaftertocitleskip}{40pt}
133 \else
134   \setlength{\cftbeforetoctitleskip}{3.5ex \@plus 1ex \@minus .2ex}
135   \setlength{\cftaftertocitleskip}{2.3ex \@plus.2ex}
136 \fi

```

`\cfttoctitlefont` The ToC title is typeset in the style given by `\cfttoctitlefont`. The macro
`\cftaftertocitle` `\cftaftertocitle` is called after typesetting the title. This is initialised to do nothing. Both these macros can be redefined to do other things (e.g., adding an `\hfill` to `\cfttoctitlefont` will make the title flushright).

```

137 \if@cfthaschapter
138   \newcommand{\cfttoctitlefont}{\normalfont\Huge\bfseries}
139   \if@cfkoma\renewcommand{\cfttoctitlefont}{\size@chapter\sectfont}\fi
140 \else
141   \newcommand{\cfttoctitlefont}{\normalfont\Large\bfseries}
142   \if@cfkoma\renewcommand{\cfttoctitlefont}{\size@section\sectfont}\fi
143 \fi
144 \newcommand{\cftaftertocitle}{}

```

`\cftsetpnumwidth` Users commands for setting `\@pnumwidth` and `\@tocrmarg`.

`\cftsetrmarg` 145 `\newcommand{\cftsetpnumwidth}[1]{\renewcommand{\@pnumwidth}{#1}}`
146 `\newcommand{\cftsetrmarg}[1]{\renewcommand{\@tocrmarg}{#1}}`

`\cftdot` In the default ToC, a dotted line can be used to provide a leader between a title and
`\cftdotfill` the page number. The definition of this leader is buried in the `\@dottedtocline` command. The `\cftdotfill{<sep>}` command provides a parameterised version of the leader code, where `<sep>` is the separation between the dots in mu units. The symbol used for the ‘dots’ in the leader is given by the value of `\cftdot`. These macros are also provided by the `ccaption` package.

```

147 \providecommand{\cftdot}{.}

```

```

148 \providecommand{\cftdotfill}[1]{%
149   \leaders\hbox{$\m@th\mkern #1 mu\hbox{\cftdot}\mkern #1 mu$}\hfill}

\cftdotsep \cftdotsep holds the default dot separation, and is also provided by the ccaption
\cftnodots package. If the kerns in \cftdotfill are large enough, then no dots will be
printed. \cftnodots should be ‘large enough’.

150 \providecommand{\cftdotsep}{4.5}
151 \newcommand{\cftnodots}{10000}

```

Now for the trickier bits regarding the typesetting of the ToC entries.

A .toc (also .lof and .lot) file consists of a list of `\contentsline{<kind>}{<title>}{<page>}` commands, where `<kind>` is the kind of heading (e.g., `part` or `section` or `figure`), `<title>` is the title text (including the number), and `<page>` is the page number. The entries are inserted into the file by calling the `\addcontentsline{<file>}{<kind>}{<title>}` command, where `<file>` is the file extension (e.g., `toc`, `lot`) and the other arguments are the same as for the `\contentsline` command. (Arbitrary stuff may also be put into the file via the `\addtocontents{<file>}{<text>}` command). The typesetting of the `\contentsline` entries is performed by commands of the form `\l@kind`. The sectioning and captioning commands call `\addcontentsline` to insert their titles into the .toc etc., files.

For the purposes at hand it is generally impossible to treat the typesetting of a title and its number separately, as both are bundled into the `<title>` argument within `\contentsline`. They could be handled separately if the `\contentsline` command was suitably modified. If this was done, then the `\addtocontentsline` command would also need to be changed which would then require the sectioning and captioning commands to be modified as well. This is certainly possible, but would cause problems if any other package also modified the sectioning or captioning commands, and there are several packages which do this.

Having said this, for all but Part entries, the sectional number is typeset via the `\numberline` command. We can take advantage of this fact.

I have taken the decision to not touch the `\contentsline` macro and instead to do what can be done with it as it exists. That is, I will modify the `\l@kind` commands. Essentially, my new definitions consist of inlined versions of the code for `\@dottedtocline`.

```

\cftparfillskip The \l@kind commands modify (locally) the value of \parfillskip. \cftparfillskip
is a copy of the default TEXbook \parfillskip definition.

152 \newcommand{\cftparfillskip}{\parfillskip=0pt plus1fil}

\numberline The purpose of the \numberline{<secnum>} command is to typeset <secnum>
left justified in a box of width \@tempdima. I redefine it to add three additional
parameters, namely \@cftbsnum, \@cftasnum and \@cftasnumb (see ltsect.dtx
for the original definition).

153 \renewcommand{\numberline}[1]{%
154   \hb@xt@\@tempdima{\@cftbsnum #1\@cftasnum\hfil}\@cftasnumb}

```

`\@cftbsnum` Originally these were not defined but were `\let` to appropriate commands in the
`\@cftasnum` `\l@. . .` commands, but they have to be defined in case something unexpected calls
`\@cftasnumb` `\numberline`, for example through use of the `float` package.⁸

```

155 \newcommand{\@cftbsnum}{}
156 \newcommand{\@cftasnum}{}
157 \newcommand{\@cftasnumb}{}

```

`\l@part` `\l@part{\langle title \rangle}{\langle page \rangle}` typesets the ToC entry for a `part` heading. It is a pa-
`\if@cftdopart` rameterised copy of the default `\l@part` (see `classes.dtx` for the original defini-
tion and the code below for `\l@subsection` for an explanation of most of this
code). By default, Parts (and Chapters) do not have dotted leaders. This package
provides for all entries to have dotted leaders.

```

```

`\@cftsetindents` `\@cftsetindents{<X>}{<indent>}{<numwidth>}` is the internal version of `\cftsetindents`, where in this case `<X>` is the internal (shorthand) name of the entry.

```

961 \newcommand{\@cftsetindents}[3]{%
962 \setlength{\@nameuse{cft#1indent}}{#2}
963 \setlength{\@nameuse{cft#1numwidth}}{#3}
964 }
965

```

3.3 Switching page numbering

`\@cftpnnumoff` `\@cftpnnumoff{<shorthand>}` is the workhorse for switching page numbering off. The `<shorthand>` argument is the shorthand name of the entry (e.g. `subsec` for subsection). The macro redefines the `\cftXnumfill` command so that there is no leader and the page number is ignored.

```

966 \newcommand{\@cftpnnumoff}[1]{%
967 \@namedef{cft#1fillnum}##1{%
968 \cftparfillskip\@nameuse{cft#1afterpnum}\par}}

```

`\cftchapname` Unfortunately an early design decision was the use shorthands like `sec` for
`\cftsecname` section. For the page switching I need to be able to correlate the shorthands
`\cftsubsecname` and longhands.

```

\cftsubsubsecname 970 \newcommand*\cftchapname{chapter}
\cftparaname       971 \newcommand*\cftsecname{section}
\cftsubparaname    972 \newcommand*\cftsubsecname{subsection}
\cftfigname        973 \newcommand*\cftsubsubsecname{subsubsection}
\cftsubfigname     974 \newcommand*\cftparaname{paragraph}
\cfttabname        975 \newcommand*\cftsubparaname{subparagraph}
\cftsubtabname     976 \newcommand*\cftfigname{figure}
                   977 \newcommand*\cftsubfigname{subfigure}
                   978 \newcommand*\cfttabname{table}
                   979 \newcommand*\cftsubtabname{subtable}
                   980

```

`\cftpagenumbersoff` The user level command for switching off page numbers is `\cftpagenumbersoff{⟨entry⟩}` where `⟨entry⟩` is the longhand name of the entry. The principal task of this macro is to determine the corresponding shorthand name of the `⟨entry⟩` and then call `\@cftpnumoff` to do the work. For part and user-defined entries the long- and short-hand entry names are identical.

```

981 \DeclareRobustCommand{\cftpagenumbersoff}[1]{%
982   \def\@cftemp{#1}
983   \ifx\@cftemp\cftchapname

1050 \fi
1051 }
1052

```

`\@cftpnumon` `\@cftpnumon{shorthand}` is the workhorse for switching page numbering off.

The *shorthand* argument is the shorthand name of the entry (e.g. `subsec` for `subsection`). The macro defines the `\cftXnumfill` command to correspond to the default definition.

```

1053 \newcommand{\@cftpnumon}[1]{%
1054   \@namedef{cft#1fillnum}##1{%
1055     {\@nameuse{cft#1leader}}\nobreak
1056     \hb@xt@\@pnumwidth{\hfil\@nameuse{cft#1pagefont}##1}\@nameuse{cft#1afterpnum}\par}}
1057

```

3.4 Experimental utilities

The code in this section is experimental but in the sense that the capabilities might be modified in the future rather than that the code does not work.

`\cftchapterprecis` This is experimental. `\cftchapterprecis{<text>}` typesets *<text>* at the point where it is called, and also adds *<text>* to the `.toc` file. It is expected to be called immediately after a `\chapter` command.

```

1058 \newcommand{\cftchapterprecis}[1]{%
1059   \cftchapterprecishere{#1}
1060   \cftchapterprecistoc{#1}}

```

`\cftchapterprecishere` `\cftchapterprecishere{<text>}` typesets *<text>*. It is expected to be called immediately after a `\chapter` command. First add some negative vertical space to move it closer to the chapter heading.

```

1061 \newcommand{\cftchapterprecishere}[1]{%
1062   \vspace*{-2\baselineskip}

```

Typeset its argument using italic font in a quote environment.

```

1063   \begin{quote}\textit{#1}\end{quote}}

```

`\cftchapterprecistoc` `\cftchapterprecistoc{<text>}` adds *<text>* to the `.toc` file. The *<text>* will be typeset within the same margins as the title text of a `\chapter` heading, using an italic font.

```

1064 \newcommand{\cftchapterprecistoc}[1]{\addtocontents{toc}{%

```

Start a group to localize changes to the paragraphing. Set the left margin to the chapter indent plus the chapter number width.

```

1065   {\leftskip \cftchapindent\relax
1066   \advance\leftskip \cftchapnumwidth\relax

```

Set the right hand margin to `\@tocrmarg`.

```

1067   \rightskip \@tocrmarg\relax

```

Typeset *<text>* using an italic font, then ensure that the paragraph is finished (to use the local skips). Finally close the group and we are done.

```

1068   \textit{#1}\protect\par}}}}
1069

```

```

\cftlocalchange \cftmakelocalchange{<file>}{<pnumwidth>}{<tocrmarg>} makes an entry into
<file> to change the \@pnumwidth and the \@tocrmarg values.
1070 \newcommand{\cftlocalchange}[3]{%
1071   \addtocontents{#1}{\protect\cftsetpnumwidth{#2} \protect\cftsetrmarg{#3}}}

\cftaddtitleline \cftaddtitleline{<file>}{<kind>}{<title>}{<page>} adds a \contentsline entry
to <file> with the given information.
1072 \newcommand{\cftaddtitleline}[4]{\addtocontents{#1}{%
1073   \protect\contentsline{#2}{#3}{#4}}}

\cftaddnumtitleline \cftaddtitleline{<file>}{<kind>}{<num>}{<title>}{<page>} adds a \contentsline
entry to <file> with the given information.
1074 \newcommand{\cftaddnumtitleline}[5]{\addtocontents{#1}{%
1075   \protect\contentsline{#2}{\protect\numberline{#3}#4}{#5}}}

And, if dear old hyperref has been used, we have to fix up these two macros.
1076 \AtBeginDocument{%
1077   \@ifpackageloaded{hyperref}{%
1078     \renewcommand{\cftaddtitleline}[4]{\addtocontents{#1}{%
1079       \protect\contentsline{#2}{#3}{#4}{\@currentHref}}}
1080     \renewcommand{\cftaddnumtitleline}[5]{\addtocontents{#1}{%
1081       \protect\contentsline{#2}{\protect\numberline{#3}#4}{#5}{\@currentHref}}}
1082   }{}
1083 }
1084

The end of this package.
1085 </usc>

```
