

The `stampinclude` package

Heiko Oberdiek

<oberdiek@uni-freiburg.de>

2008/07/14 v1.0

Abstract

The package replaces `\includeonly` and selects the files for `\include` by inspecting the time stamp of the `.aux` file. The file is selected for inclusion if the `.aux` file does not yet exist or is older than the corresponding `.tex` file.

1 Documentation

1.1 Introduction

L^AT_EX provides two commands `\include` and `\includeonly` that helps in organizing large projects. Example for a master file:

```
\documentclass{book}
  % \includeonly{}
\begin{document}
\include{fileA}
\include{fileB}
\include{fileC}
\end{document}
```

All files are read and compiled if `\includeonly` is not executed. Otherwise you can give `\includeonly` a list of files in the preamble, e.g.:

```
\includeonly{fileA,fileC}
```

Now only files `fileA.tex` and `fileC.tex` are read and compiled.

If you change file `fileB.tex` and want to see only this file, then you must change the line with `\includeonly` to

```
\includeonly{fileB}
```

It is tedious to do this again and again, if different files are changed.

Package `askinlude` [1] offers a solution for this problem. It interactively asks for the files to be included and saves the user from editing the master file.

This package `stampinclude` goes another way. L^AT_EX reads and writes a separate `.aux` file for each file that is included by `\include`. There L^AT_EX remembers counter values. Changed `.tex` files can therefore be detected by comparing the file date stamp of the `.tex` file with the date stamp of its `.aux` file. Since version 1.30.0 pdfT_EX provides `\pdffilemoddate` that reads the file date stamp. Thus this package uses this command and redefines `\include` to include the files that do not have `.aux` files yet or that are newer than its `.aux` file. `\includeonly` is ignored.

1.2 Usage

The package is loaded as normal L^AT_EX package without options:

```
\usepackage{stampinclude}
```

Alternatively the package may be loaded on the command line (Example for shell ‘bash’):

```
latex '\AtBeginDocument{\usepackage{stampinclude}}\input{master}'
```

Without `\AtBeginDocument` (and `\RequirePackage` instead of `\usepackage`) T_EX would name the document `stampinclude.dvi` instead of `master.dvi`.

1.3 Limitations

1.3.1 Other file dependencies

A file that is included by `\include` may input or reference other files:

- other T_EX files using `\input`,
- graphics files (`\includegraphics`),
- listings of external files,
- ...

Updates of those files are not detected by this package. It limits the date stamp comparison of an `.aux` file to its `.tex` file.

1.3.2 `\include` dependencies

In the example, given in the introduction 1.1, three files `fileA`, `fileB`, and `fileC` are included in this order. Now file `fileA` is changed by adding four pages, `fileB` remains untouched, and `fileC` is also updated. Then the package only selects `fileA` and `fileC` for inclusion. File `fileB` is not included. But L^AT_EX has stored the counter values that are active at the end of `fileB` in `fileB.aux` in one of the previous runs when `fileB` was included. However the later addition of four pages in `fileA` was not known at that time. Therefore `fileB.aux` is out of date and the inclusion of file `fileC` starts with wrong counter values (especially the page counter).

1.3.3 Summary

This package `stampinclude` and the `\include` feature helps in accelerating the L^AT_EX compilation. But it is not intended for generating the final version. For the final version of the document it is better to include *all* files to get all counter values right. Then this package and any `\includeonly` lines should be commented out:

```
% \usepackage{stampinclude}
% \includeonly{...}
```

1.4 Requirements

- pdfTeX v1.30.0 (because of `\pdffilemoddate` and `\pdfstrcmp`), both modes for DVI and PDF are supported.
- Alternatively LuaTeX may be used. It lacks `\pdffilemoddate` and `\pdfstrcmp`. But its services are provided by package `pdftexcmds` [2] that is automatically loaded.

2 Implementation

```
1 {*package}
2 \NeedsTeXFormat{LaTeX2e}

3 Installation

3.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/stampinlude.dtx](http://CTAN.mirror/CTAN/macros/latex/contrib/oberdiek/stampinlude.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/stampinlude.pdf](http://CTAN.mirror/CTAN/macros/latex/contrib/oberdiek/stampinlude.pdf) Documentation.

¹[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://CTAN/install/macros/latex/contrib/oberdiek.tds.zip)

TDS refers to the standard “A Directory Structure for \TeX Files” (CTAN:tds/tds.pdf). Directories with `texmf` in their name are usually organized this way.

3.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDSScripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

3.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain- \TeX :

```
tex stampinclude.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
stampinclude.sty → tex/latex/oberdiek/stampinclude.sty
stampinclude.pdf → doc/latex/oberdiek/stampinclude.pdf
stampinclude.dtx → source/latex/oberdiek/stampinclude.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

3.4 Refresh file name databases

If your \TeX distribution (te \TeX , mik \TeX , ...) relies on file name databases, you must refresh these. For example, te \TeX users run `texhash` or `mktexlsr`.

3.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk stampinclude.pdf unpack_files output .
```

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain-T_EX: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{stampinclude.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex stampinclude.dtx
makeindex -s gind.ist stampinclude.idx
pdflatex stampinclude.dtx
makeindex -s gind.ist stampinclude.idx
pdflatex stampinclude.dtx
```
