

Uniform Resource Identifier (URI) Scheme and  
Applicability Statement for the  
Trivial File Transfer Protocol (TFTP)

Status of this Memo

This memo provides information for the Internet community. It does not specify an Internet standard of any kind. Distribution of this memo is unlimited.

Abstract

The Trivial File Transfer Protocol (TFTP) is a very simple TRIVIAL protocol that has been in use on the Internet for quite a long time. While this document discourages its continued use, largely due to security concerns, we do define a Uniform Resource Identifier (URI) scheme, as well as discuss the protocol's applicability.

1. Introduction

The Trivial File Transfer Protocol (TFTP) has been around for quite some time. Its common uses are to initially configure devices or to load new versions of operating system code [1]. As devices begin to adopt use of Uniform Resource Identifiers (URIs) and Uniform Resource Locators (URLs), for completeness we specify a way to reference files that is still quite common. Use of a URI is a convenient way to indicate underlying mechanism, server name or address, and file name.

WHILE WE DEFINE THE TFTP URI TYPE, WE STRONGLY RECOMMEND AGAINST THE CONTINUED USE OF TFTP, FOR REASONS LISTED IN SECTION 5 (amongst others). The definition of a URI merely allows tools that currently use protocols such as TFTP to have a standard name space and structure where one can understand the process used to resolve that name. Indeed it is hoped that the definition of this URI will ease transition to modern file transfer mechanisms.

## 2. Syntax of a TFTP URI

A TFTP URI has the following ABNF syntax [2]:

```
tftpURI      = "tftp://" host "/" file [ mode ]
mode         = ";" "mode=" ( "netascii" / "octet" )
file         = *( unreserved / escaped )
host         = <as specified by RFC 2732 [3]>
unreserved  = <as specified in RFC 2396 [4]>
escaped     = <as specified in RFC 2396>
```

A TFTP URI specifies a file that is to be found or placed on a TFTP server. The "mode" option is an option indicating how the file is to be transferred. If left unspecified, the mode is assumed to be "octet". A third "mail" mode was deprecated at the time RFC 1350 was adopted, and is not specified.

### 2.1. Encoding Rules

Aside from syntax as described above, the TFTP protocol does not specify length limits to either file names or file sizes. In the case of file names, they may contain any character so long as those characters are properly escaped as described above.

## 3. Semantics and Operations

As previously stated the TFTP URI is a reference to a file. The allowed operations on a TFTP URI are read and write. When a TFTP URI is read the underlying mechanisms retrieve the named file via the TFTP protocol from the specified host with the optionally specified mode. When a TFTP URI is written the underlying mechanisms transmit a file via TFTP to a specified server to either the specified file using the optionally specified mode. No other operations are supported.

Note that it is not possible to retrieve file size information prior to retrieval, nor is it possible to determine file existence or permissions prior to transfer. Files transferred may or may not arrive intact, as there is no guarantee of reliability or even completeness. See the TFTP standard for more details. For more robust file transfer, consider using either FTP or HTTP [5, 6].

#### 4. Examples

```
tftp://example.com/myconfigurationfile;mode=netascii
```

This example references file "myconfigurationfile" on server "example.com" and requests that the transfer occur in netascii mode.

```
tftp://example.com/mystartupfile
```

This file references file "mystartupfile" on server "example.com". The transfer should occur in octet mode, since no other mode was specified.

#### 5. Security Considerations and Concerns about TFTP's use

Use of TFTP has been historically limited to those devices where a more full protocol stack is impractical due to either memory or CPU constraints. While this still may be the case with a toaster, it is unlikely to be the case for even the simplest piece of network support hardware, such as simple routers or switches. There are a myriad of reasons to use some protocol other than TFTP, only a few of which are listed below.

TFTP has no mechanism for access control within the protocol, and there is no protection from a man in the middle attack. Implementations are left to their own devices in this area. Because TFTP has no way to determine file sizes in advance, implementations should be prepared to properly check the bounds of transfers so that neither memory nor disk limitations are exceeded.

TFTP is not well suited to large files for the following reasons. TFTP has no inherent integrity check. There is no way to determine what one side sent is what the other received. There is no way to restart TFTP transfers from anywhere other than the beginning. TFTP is a lock step protocol. Only one packet may be in flight at any one time. There is no slow start or smart backoff mechanism in TFTP, but very simple timeouts.

TFTP is not well suited to file transfers across administrative domains. For one thing, TFTP utilizes UDP, and many NATs will not either support or allow TFTP transfers. More likely firewalls will prohibit transfers.

There are no caching semantics within TFTP. There is no safe way to cache information using the TFTP protocol.

In summary, use of TFTP is strongly discouraged except in the most limited of circumstances where memory and CPU are at the highest premium.

## 6. IANA Considerations

The IANA has registered the URL registration template found in Appendix A in accordance with RFC 2717 [7].

## 7. Acknowledgments

The author thanks Larry Masinter, Randy Presuhn, Phil Schafer, and Bill Fenner for their help in developing this document.

## 8. Intellectual Property Statement

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

## Appendix A. Registration Template

URL scheme name: tftp  
URL scheme syntax: Section 2  
Character encoding considerations: Section 2  
Intended usage: Section 1  
Applications and/or protocols which use this scheme: [1]  
Interoperability considerations: None  
Security considerations: Section 5  
Relevant publications: [1]  
Contact: The author, Section 8  
Author/Change Controller: IESG
