## 1 util-vserver (libvserver) Module Index

### 1.1 util-vserver (libvserver) Modules

Here is a list of all modules:

<a href="#">Syscall wrappers</a>	<a href="#">2</a>
<a href="#">Helper functions</a>	<a href="#">7</a>

## 2 util-vserver (libvserver) Data Structure Index

### 2.1 util-vserver (libvserver) Data Structures

Here are the data structures with brief descriptions:

<a href="#">Mapping_uint32</a>	<a href="#">10</a>
<a href="#">Mapping_uint64</a>	<a href="#">10</a>
<a href="#">vc_ctx_caps (Capabilities of process-contexts )</a>	<a href="#">11</a>
<a href="#">vc_ctx_dlimit</a>	<a href="#">11</a>
<a href="#">vc_ctx_flags (Flags of process-contexts )</a>	<a href="#">12</a>
<a href="#">vc_ctx_stat (Statistics about a context )</a>	<a href="#">12</a>
<a href="#">vc_err_listparser (Information about parsing errors )</a>	<a href="#">13</a>
<a href="#">vc_ip_mask_pair</a>	<a href="#">13</a>
<a href="#">vc_net_caps</a>	<a href="#">13</a>
<a href="#">vc_net_flags</a>	<a href="#">14</a>

<a href="#">vc_net_nx</a>	14
<a href="#">vc_nx_info</a>	14
<a href="#">vc_rlimit</a> (The limits of a resources )	15
<a href="#">vc_rlimit_mask</a> (Masks describing the supported limits )	15
<a href="#">vc_rlimit_stat</a> (Statistics for a resource limit )	16
<a href="#">vc_set_sched</a>	16
<a href="#">vc_virt_stat</a> (Contains further statistics about a context )	17
<a href="#">vc_vx_info</a>	17

### 3 util-vserver (libvserver) File Index

#### 3.1 util-vserver (libvserver) File List

Here is a list of all documented files with brief descriptions:

<a href="#">internal.h</a> (Declarations which are used by util-vserver internally )	18
<a href="#">vserver.h</a> (The public interface of the the libvserver library )	19

### 4 util-vserver (libvserver) Module Documentation

#### 4.1 Syscall wrappers

##### Functions

- [int vc\\_syscall](#) (uint32\_t cmd, [xid\\_t](#) xid, void \*data)  
*The generic vserver syscall*  
*This function executes the generic vserver syscall. It uses the correct syscallnumber (which may differ between the different architectures).*
- [int vc\\_get\\_version](#) ()  
*Returns the version of the current kernel API.*
- [int vc\\_get\\_vci](#) ()  
*Returns the kernel configuration bits.*
- [xid\\_t vc\\_new\\_s\\_context](#) ([xid\\_t](#) ctx, unsigned int remove\_cap, unsigned int flags)  
*Moves current process into a context*  
*Puts current process into context ctx, removes the capabilities given in remove\_cap and sets flags.*
- [int vc\\_set\\_ipv4root](#) (uint32\_t bcast, size\_t nb, struct [vc\\_ip\\_mask\\_pair](#) const \*ips)  
*Sets the ipv4root information.*
- [xid\\_t vc\\_ctx\\_create](#) ([xid\\_t](#) xid)

*Creates a context without starting it.*

*This functions initializes a new context. When already in a freshly created context, this old context will be discarded.*

- `int vc_ctx_migrate (xid_t xid)`  
*Moves the current process into the specified context.*
- `int vc_ctx_stat (xid_t xid, struct vc_ctx_stat *stat)`  
*Get some statistics about a context.*
- `int vc_virt_stat (xid_t xid, struct vc_virt_stat *stat)`  
*Get more statistics about a context.*
- `int vc_get_rlimit (xid_t xid, int resource, struct vc_rlimit *lim)`  
*Returns the limits of resource.*
- `int vc_set_rlimit (xid_t xid, int resource, struct vc_rlimit const *lim)`  
*Sets the limits of resource.*
- `int vc_rlimit_stat (xid_t xid, int resource, struct vc_rlimit_stat *stat)`  
*Returns the current stats of resource.*
- `int vc_reset_minmax (xid_t xid)`  
*Resets the minimum and maximum observed values for all resources.*
- `int vc_ctx_kill (xid_t ctx, pid_t pid, int sig)`  
*Sends a signal to a context/pid*  
*Special values for pid are:*
  - *-1 which means every process in ctx except the init-process*
  - *0 which means every process in ctx inclusive the init-process.*
- `int vc_get_iattr (char const *filename, xid_t *xid, uint_least32_t *flags, uint_least32_t *mask)`  
*Returns information about attributes and assigned context of a file.*  
*This function returns the VC\_IATTR\_XXX flags and about the assigned context of a file. To request an information, the appropriate bit in mask must be set and the corresponding parameter (xid or flags) must not be NULL.*
- `xid_t vc_get_task_xid (pid_t pid)`  
*Returns the context of the given process.*
- `xid_t vc_getfilecontext (char const *filename)`  
*Returns the context of filename*  
*This function calls vc\_get\_iattr() with appropriate arguments to determine the context of filename. In error-case or when no context is assigned, VC\_NOCTX will be returned. To differ between both cases, errno must be examined.*
- `int vc_wait_exit (xid_t xid)`  
*Waits for the end of a context.*

### 4.1.1 Detailed Description

Functions which are calling the vserver syscall directly.

### 4.1.2 Function Documentation

#### 4.1.2.1 `xid_t vc_ctx_create (xid_t xid)`

Creates a context without starting it.

This functions initializes a new context. When already in a freshly created context, this old context will be discarded.

**Parameters:**

- xid* The new context; special values are:
- VC\_DYNAMIC\_XID which means to create a dynamic context

**Returns:**

the xid of the created context, or VC\_NOCTX on errors. `errno` will be set appropriately.

#### 4.1.2.2 `int vc_ctx_migrate (xid_t xid)`

Moves the current process into the specified context.

**Parameters:**

*xid* The new context

**Returns:**

0 on success, -1 on errors

#### 4.1.2.3 `int vc_ctx_stat (xid_t xid, struct vc_ctx_stat * stat)`

Get some statistics about a context.

**Parameters:**

*xid* The context to get stats about  
*stat* Where to store the result

**Returns:**

0 on success, -1 on errors.

#### 4.1.2.4 `int vc_get_iattr (char const * filename, xid_t * xid, uint_least32_t * flags, uint_least32_t * mask)`

Returns information about attributes and assigned context of a file.

This function returns the VC\_IATTR\_XXX flags and about the assigned context of a file. To request an information, the appropriate bit in *mask* must be set and the corresponding parameter (*xid* or *flags*) must not be NULL.

E.g. to receive the assigned context, the VC\_IATTR\_XID bit must be set in *mask*, and *xid* must point to valid memory.

Possible flags are VC\_IATTR\_ADMIN, VC\_IATTR\_WATCH, VC\_IATTR\_HIDE, VC\_IATTR\_BARRIER, VC\_IATTR\_IUNLINK and VC\_IATTR\_IMMUTABLE.

**Parameters:**

*filename* The name of the file whose attributes shall be determined.

*xid* When non-zero and the VC\_IATTR\_XID bit is set in *mask*, the assigned context of *filename* will be stored there.

*flags* When non-zero, a bitmask of current attributes will be stored there. These attributes must be requested explicitly by setting the appropriate bit in *mask*

*mask* Points to a bitmask which tells which attributes shall be determined. On return, it will masquerade the attributes which were determined.

**Precondition:**

`mask!=0 && !((*mask&VC_IATTR_XID) && xid==0) && !((*mask&~VC_IATTR_XID) && flags==0)`

**4.1.2.5 int vc\_get\_rlimit (xid\_t xid, int resource, struct vc\_rlimit \* lim)**

Returns the limits of *resource*.

**Parameters:**

*xid* The id of the context

*resource* The resource which will be queried

*lim* The result which will be filled with the limits

**Returns:**

0 on success, and -1 on errors.

**4.1.2.6 xid\_t vc\_get\_task\_xid (pid\_t pid)**

Returns the context of the given process.

**Parameters:**

*pid* the process-id whose xid shall be determined; pid==0 means the current process.

**Returns:**

the xid of process *pid* or -1 on errors

**4.1.2.7 int vc\_get\_vci ()**

Returns the kernel configuration bits.

**Returns:**

The kernel configuration bits

**4.1.2.8 int vc\_get\_version ()**

Returns the version of the current kernel API.

**Returns:**

The versionnumber of the kernel API

#### 4.1.2.9 `xid_t vc_getfilecontext (char const *filename)`

Returns the context of `filename`

This function calls `vc_get_iattr()` with appropriate arguments to determine the context of `filename`. In error-case or when no context is assigned, `VC_NOCTX` will be returned. To differ between both cases, `errno` must be examined.

**WARNING:** this function can modify `errno` although no error happened.

**Parameters:**

*filename* The file to check

**Returns:**

The assigned context, or `VC_NOCTX` when an error occurred or no such assignment exists. `errno` will be 0 in the latter case

#### 4.1.2.10 `xid_t vc_new_s_context (xid_t ctx, unsigned int remove_cap, unsigned int flags)`

Moves current process into a context

Puts current process into context `ctx`, removes the capabilities given in `remove_cap` and sets `flags`.

**Parameters:**

*ctx* The new context; special values for are

- `VC_SAMECTX` which means the current context (just for changing caps and flags)
- `VC_DYNAMIC_XID` which means the next free context; this value can be used by ordinary users also

*remove\_cap* The linux capabilities which will be **removed**.

*flags* Special flags which will be set.

**Returns:**

The new context-id, or `VC_NOCTX` on errors; `errno` will be set appropriately

See <http://vserver.13thfloor.at/Stuff/Logic.txt> for details

#### 4.1.2.11 `int vc_reset_minmax (xid_t xid)`

Resets the minimum and maximum observed values for all resources.

**Parameters:**

*xid* The id of the context

**Returns:**

0 on success, and -1 on errors.

#### 4.1.2.12 `int vc_rlimit_stat (xid_t xid, int resource, struct vc_rlimit_stat *stat)`

Returns the current stats of *resource*.

**Parameters:**

*xid* The id of the context

*resource* The resource which will be queried  
*stat* The result which will be filled with the stats

**Returns:**

0 on success, and -1 on errors.

**4.1.2.13 int vc\_set\_ipv4root (uint32\_t bcast, size\_t nb, struct vc\_ip\_mask\_pair const \* ips)**

Sets the ipv4root information.

**Precondition:**

$nb < \text{NB\_IPV4ROOT}$  &&  $ips \neq 0$

**4.1.2.14 int vc\_set\_rlimit (xid\_t xid, int resource, struct vc\_rlimit const \* lim)**

Sets the limits of *resource*.

**Parameters:**

*xid* The id of the context  
*resource* The resource which will be queried  
*lim* The new limits

**Returns:**

0 on success, and -1 on errors.

**4.1.2.15 int vc\_syscall (uint32\_t cmd, xid\_t xid, void \* data)**

The generic vserver syscall

This function executes the generic vserver syscall. It uses the correct syscallnumber (which may differ between the different architectures).

**Parameters:**

*cmd* the command to be executed  
*xid* the xid on which the cmd shall be applied  
*data* additional arguments; depends on *cmd*

**Returns:**

depends on *cmd*; usually, -1 stands for an error

**4.1.2.16 int vc\_virt\_stat (xid\_t xid, struct vc\_virt\_stat \* stat)**

Get more statistics about a context.

**Parameters:**

*xid* The context to get stats about  
*stat* Where to store the result

**Returns:**

0 on success, -1 on errors.

## 4.2 Helper functions

### Data Structures

- struct `vc_err_listparser`

*Information about parsing errors.*

### Functions

- size\_t `vc_get_nb_ipv4root` () VC\_ATTR\_CONST

*Returns the value of NB\_IPV4ROOT.*

*This function returns the value of NB\_IPV4ROOT which was used when the library was built, but **not** the value which is used by the currently running kernel.*

- bool `vc_parseLimit` (char const \*str, vc\_limit\_t \*res)

*Parses a string describing a limit*

*This function parses str and interprets special words like "inf" or suffixes. Valid suffixes are*

- k ... 1000
- m ... 1000000
- K ... 1024
- M ... 1048576.

- uint\_least64\_t `vc_text2bcap` (char const \*str, size\_t len)

*Converts a single string into bcapability.*

- char const \* `vc_lobcap2text` (uint\_least64\_t \*val)

*Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.*

- int `vc_list2bcap` (char const \*str, size\_t len, struct `vc_err_listparser` \*err, struct `vc_ctx_caps` \*cap)

*Converts a string into a bcapability-bitmask*

*Syntax of str:.*

### 4.2.1 Detailed Description

Functions which are doing general helper tasks like parameter parsing.

### 4.2.2 Function Documentation

#### 4.2.2.1 int `vc_list2bcap` (char const \*str, size\_t len, struct `vc_err_listparser` \*err, struct `vc_ctx_caps` \*cap)

Converts a string into a bcapability-bitmask

Syntax of str:.

```
LIST  <- ELEM | ELEM ' ' LIST
ELEM  <- '~' ELEM | MASK | NAME
MASK  <- NUMBER | '^' NUMBER
NUMBER <- 0[0-7]* | [1-9][0-9]* | 0x[0-9,a-f]+
NAME  <- <literal name> | "all" | "any" | "none"
```

When the `~` prefix is used, the bits will be unset and a `~` after another `~` will cancel both ones. The `^` prefix specifies a bitnumber instead of a bitmask.

"literal name" is everything which will be accepted by the `vc_text2bcap()` function. The special values for NAME will be recognized case insensitively

**Parameters:**

- str* The string to be parsed
- len* The length of the string, or 0 for automatic detection
- err* Pointer to a structure for error-information, or NULL.
- cap* Pointer to a `vc_ctx_caps` structure holding the results; only the *bcaps* and *bmask* fields will be changed and already set values will not be honored. When an error occurred, *cap* will have the value of all processed valid BCAP parts.

**Returns:**

0 on success, -1 on error. In error case, *err* will hold position and length of the first not understood BCAP part

**Precondition:**

*str* != 0 && *cap* != 0; *cap*->*bcaps* and *cap*->*bmask* must be initialized

#### 4.2.2.2 char const\* vc\_lobcap2text (uint\_least64\_t \* val)

Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.

**Parameters:**

- val* The string to be converted; on success, the detected bit(s) will be unset, in errorcase only the lowest set bit

**Returns:**

A textual representation of *val* resp. of its lowest set bit; or NULL in errorcase.

**Precondition:**

*val* != 0

**Postcondition:**

*\*val<sub>old</sub>* != 0 <-> *\*val<sub>old</sub>* > *\*val<sub>new</sub>*  
*\*val<sub>old</sub>* == 0 --> *result* == 0

#### 4.2.2.3 bool vc\_parseLimit (char const \* str, vc\_limit\_t \* res)

Parses a string describing a limit

This function parses *str* and interprets special words like "inf" or suffixes. Valid suffixes are

- k ... 1000
- m ... 1000000
- K ... 1024
- M ... 1048576.

**Parameters:**

*str* The string which shall be parsed

*res* Will be filled with the interpreted value; in errorcase, this value is undefined.

**Returns:**

*true*, iff the string *str* could be parsed. *res* will be filled with the interpreted value in this case.

**Precondition:**

*str*!=0 && *res*!=0

**4.2.2.4 uint\_least64\_t vc\_text2bcap (char const \* *str*, size\_t *len*)**

Converts a single string into bcapability.

**Parameters:**

*str* The string to be parsed; both "CAP\_XXX" and "XXX" will be accepted

*len* The length of the string, or 0 for automatic detection

**Returns:**

0 on error; a bitmask on success

**Precondition:**

*str* != 0

## 5 util-vserver (libvserver) Data Structure Documentation

### 5.1 Mapping\_uint32 Struct Reference

**Data Fields**

- char const \*const [id](#)
- size\_t [len](#)
- uint\_least32\_t [val](#)

**5.1.1 Detailed Description**

Definition at line 62 of file internal.h.

The documentation for this struct was generated from the following file:

- [internal.h](#)

### 5.2 Mapping\_uint64 Struct Reference

**Data Fields**

- char const \*const [id](#)
- size\_t [len](#)
- uint\_least64\_t [val](#)

### 5.2.1 Detailed Description

Definition at line 68 of file internal.h.

The documentation for this struct was generated from the following file:

- [internal.h](#)

## 5.3 vc\_ctx\_caps Struct Reference

Capabilities of process-contexts.

```
#include <vserver.h>
```

### Data Fields

- `uint_least64_t bcaps`  
*Mask of set common system capabilities.*
- `uint_least64_t bmask`  
*Mask of set and unset common system capabilities when used by set operations, or the modifiable capabilities when used by get operations.*
- `uint_least64_t ccaps`  
*Mask of set process context capabilities.*
- `uint_least64_t cmask`  
*Mask of set and unset process context capabilities when used by set operations, or the modifiable capabilities when used by get operations.*

### 5.3.1 Detailed Description

Capabilities of process-contexts.

Definition at line 648 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.4 vc\_ctx\_dlimit Struct Reference

### Data Fields

- `uint_least32_t space_used`
- `uint_least32_t space_total`
- `uint_least32_t inodes_used`
- `uint_least32_t inodes_total`
- `uint_least32_t reserved`

### 5.4.1 Detailed Description

Definition at line 825 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.5 vc\_ctx\_flags Struct Reference

Flags of process-contexts.

```
#include <vserver.h>
```

### Data Fields

- `uint_least64_t` [flagword](#)  
*Mask of set context flags.*
- `uint_least64_t` [mask](#)  
*Mask of set and unset context flags when used by set operations, or modifiable flags when used by get operations.*

### 5.5.1 Detailed Description

Flags of process-contexts.

Definition at line 638 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.6 vc\_ctx\_stat Struct Reference

Statistics about a context.

```
#include <vserver.h>
```

### Data Fields

- `uint_least32_t` [usecnt](#)  
*number of uses*
- `uint_least32_t` [tasks](#)  
*number of tasks*

### 5.6.1 Detailed Description

Statistics about a context.

Definition at line 383 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.7 `vc_err_listparser` Struct Reference

Information about parsing errors.

```
#include <vserver.h>
```

### Data Fields

- `char const * ptr`  
*Pointer to the first character of an erroneous string.*
- `size_t len`  
*Length of the erroneous string.*

### 5.7.1 Detailed Description

Information about parsing errors.

Definition at line 666 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.8 `vc_ip_mask_pair` Struct Reference

### Data Fields

- `uint32_t ip`
- `uint32_t mask`

### 5.8.1 Detailed Description

Definition at line 298 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.9 vc\_net\_caps Struct Reference

### Data Fields

- uint\_least64\_t [ncaps](#)
- uint\_least64\_t [cmask](#)

#### 5.9.1 Detailed Description

Definition at line 558 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.10 vc\_net\_flags Struct Reference

### Data Fields

- uint\_least64\_t [flagword](#)
- uint\_least64\_t [mask](#)

#### 5.10.1 Detailed Description

Definition at line 549 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.11 vc\_net\_nx Struct Reference

### Data Fields

- [vc\\_net\\_nx\\_type](#) type
- size\_t [count](#)
- uint32\_t [ip](#) [4]
- uint32\_t [mask](#) [4]

#### 5.11.1 Detailed Description

Definition at line 536 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.12 vc\_nx\_info Struct Reference

### Data Fields

- [nid\\_t](#) [nid](#)

### 5.12.1 Detailed Description

Definition at line 525 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.13 `vc_rlimit` Struct Reference

The limits of a resources.

```
#include <vserver.h>
```

### Data Fields

- [vc\\_limit\\_t min](#)  
*the guaranted minimum of a resources*
- [vc\\_limit\\_t soft](#)  
*the softlimit of a resource*
- [vc\\_limit\\_t hard](#)  
*the absolute hardlimit of a resource*

### 5.13.1 Detailed Description

The limits of a resources.

This is a triple consisting of a minimum, soft and hardlimit.

Definition at line 434 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.14 `vc_rlimit_mask` Struct Reference

Masks describing the supported limits.

```
#include <vserver.h>
```

### Data Fields

- [uint\\_least32\\_t min](#)  
*masks the resources supporting a minimum limit*
- [uint\\_least32\\_t soft](#)  
*masks the resources supporting a soft limit*

- `uint_least32_t` [hard](#)  
*masks the resources supporting a hard limit*

#### 5.14.1 Detailed Description

Masks describing the supported limits.

Definition at line 441 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.15 `vc_rlimit_stat` Struct Reference

Statistics for a resource limit.

```
#include <vserver.h>
```

#### Data Fields

- `uint_least32_t` [hits](#)  
*number of hits on the limit*
- `uint_least64_t` [value](#)  
*current value*
- `uint_least64_t` [minimum](#)  
*minimum value observed*
- `uint_least64_t` [maximum](#)  
*maximum value observed*

#### 5.15.1 Detailed Description

Statistics for a resource limit.

Definition at line 448 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.16 `vc_set_sched` Struct Reference

#### Data Fields

- `uint_least32_t` [set\\_mask](#)
- `int_least32_t` [fill\\_rate](#)

- `int_least32_t` [interval](#)
- `int_least32_t` [fill\\_rate2](#)
- `int_least32_t` [interval2](#)
- `int_least32_t` [tokens](#)
- `int_least32_t` [tokens\\_min](#)
- `int_least32_t` [tokens\\_max](#)
- `int_least32_t` [priority\\_bias](#)
- `int_least32_t` [cpu\\_id](#)
- `int_least32_t` [bucket\\_id](#)

### 5.16.1 Detailed Description

Definition at line 808 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.17 `vc_virt_stat` Struct Reference

Contains further statistics about a context.

```
#include <vserver.h>
```

### Data Fields

- `uint_least64_t` [offset](#)
- `uint_least32_t` [uptime](#)
- `uint_least32_t` [nr\\_threads](#)
- `uint_least32_t` [nr\\_running](#)
- `uint_least32_t` [nr\\_uninterruptible](#)
- `uint_least32_t` [nr\\_onhold](#)
- `uint_least32_t` [nr\\_forks](#)
- `uint_least32_t` [load](#) [3]

### 5.17.1 Detailed Description

Contains further statistics about a context.

Definition at line 398 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 5.18 `vc_vx_info` Struct Reference

### Data Fields

- `xid_t` [xid](#)
- `pid_t` [initpid](#)

### 5.18.1 Detailed Description

Definition at line 602 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

## 6 util-vserver (libvserver) File Documentation

### 6.1 internal.h File Reference

Declarations which are used by util-vserver internally.

```
#include "fmt.h"
#include "vserver.h"
#include <stdlib.h>
#include <stdbool.h>
```

### 6.1.1 Detailed Description

Declarations which are used by util-vserver internally.

Definition in file [internal.h](#).

## 6.2 vserver.h File Reference

The public interface of the the libvserver library.

```
#include <stdint.h>
#include <stdlib.h>
#include <stdbool.h>
#include <sys/types.h>
#include <sched.h>
#include <vserver-compat.h>
```

Include dependency graph for vserver.h:

This graph shows which files directly or indirectly include this file:

`vcCFG_RECENT_FULL` }

## Functions

- int `vc_syscall` (uint32\_t cmd, `xid_t` xid, void \*data)  
*The generic vserver syscall*  
*This function executes the generic vserver syscall. It uses the correct syscallnumber (which may differ between the different architectures).*
- int `vc_get_version` ()  
*Returns the version of the current kernel API.*
- int `vc_get_vci` ()  
*Returns the kernel configuration bits.*
- `xid_t` `vc_new_s_context` (`xid_t` ctx, unsigned int remove\_cap, unsigned int flags)  
*Moves current process into a context*  
*Puts current process into context ctx, removes the capabilities given in remove\_cap and sets flags.*
- int `vc_set_ipv4root` (uint32\_t bcast, size\_t nb, struct `vc_ip_mask_pair` const \*ips)  
*Sets the ipv4root information.*
- size\_t `vc_get_nb_ipv4root` () VC\_ATTR\_CONST  
*Returns the value of NB\_IPV4ROOT.*  
*This function returns the value of NB\_IPV4ROOT which was used when the library was built, but **not** the value which is used by the currently running kernel.*
- `xid_t` `vc_ctx_create` (`xid_t` xid)  
*Creates a context without starting it.*  
*This functions initializes a new context. When already in a freshly created context, this old context will be discarded.*
- int `vc_ctx_migrate` (`xid_t` xid)  
*Moves the current process into the specified context.*
- int `vc_ctx_stat` (`xid_t` xid, struct `vc_ctx_stat` \*stat)  
*Get some statistics about a context.*
- int `vc_virt_stat` (`xid_t` xid, struct `vc_virt_stat` \*stat)  
*Get more statistics about a context.*
- int `vc_get_rlimit` (`xid_t` xid, int resource, struct `vc_rlimit` \*lim)  
*Returns the limits of resource.*
- int `vc_set_rlimit` (`xid_t` xid, int resource, struct `vc_rlimit` const \*lim)

*Sets the limits of resource.*

- int **vc\_get\_rlimit\_mask** (xid\_t xid, struct **vc\_rlimit\_mask** \*lim)
- int **vc\_rlimit\_stat** (xid\_t xid, int resource, struct **vc\_rlimit\_stat** \*stat)

*Returns the current stats of resource.*

- int **vc\_reset\_minmax** (xid\_t xid)

*Resets the minimum and maximum observed values for all resources.*

- bool **vc\_parseLimit** (char const \*str, **vc\_limit\_t** \*res)

*Parses a string describing a limit*

*This function parses str and interprets special words like "inf" or suffixes. Valid suffixes are*

- k ... 1000
- m ... 1000000
- K ... 1024
- M ... 1048576.

- int **vc\_ctx\_kill** (xid\_t ctx, pid\_t pid, int sig)

*Sends a signal to a context/pid*

*Special values for pid are:*

- -1 which means every process in ctx except the init-process
- 0 which means every process in ctx inclusive the init-process.

- **nid\_t** **vc\_get\_task\_nid** (pid\_t pid)
- int **vc\_get\_nx\_info** (**nid\_t** nid, struct **vc\_nx\_info** \*)
- **nid\_t** **vc\_net\_create** (**nid\_t** nid)
- int **vc\_net\_migrate** (**nid\_t** nid)
- int **vc\_net\_add** (**nid\_t** nid, struct **vc\_net\_nx** const \*info)
- int **vc\_net\_remove** (**nid\_t** nid, struct **vc\_net\_nx** const \*info)
- int **vc\_get\_nflags** (**nid\_t**, struct **vc\_net\_flags** \*)
- int **vc\_set\_nflags** (**nid\_t**, struct **vc\_net\_flags** const \*)
- int **vc\_get\_ncaps** (**nid\_t**, struct **vc\_net\_caps** \*)
- int **vc\_set\_ncaps** (**nid\_t**, struct **vc\_net\_caps** const \*)
- int **vc\_set\_iattr** (char const \*filename, xid\_t xid, uint\_least32\_t flags, uint\_least32\_t mask)
- int **vc\_get\_iattr** (char const \*filename, xid\_t \*xid, uint\_least32\_t \*flags, uint\_least32\_t \*mask)

*Returns information about attributes and assigned context of a file.*

*This function returns the VC\_IATTR\_XXX flags and about the assigned context of a file. To request an information, the appropriate bit in mask must be set and the corresponding parameter (xid or flags) must not be NULL.*

- **xid\_t** **vc\_get\_task\_xid** (pid\_t pid)

*Returns the context of the given process.*

- int **vc\_get\_vx\_info** (xid\_t xid, struct **vc\_vx\_info** \*info)
- int **vc\_set\_vhi\_name** (xid\_t xid, **vc\_uts\_type** type, char const \*val, size\_t len)
- int **vc\_get\_vhi\_name** (xid\_t xid, **vc\_uts\_type** type, char \*val, size\_t len)
- bool **vc\_is\_dynamic\_xid** (xid\_t xid)
- int **vc\_enter\_namespace** (xid\_t xid, uint\_least64\_t mask)
- int **vc\_set\_namespace** (xid\_t xid, uint\_least64\_t mask)
- int **vc\_cleanup\_namespace** ()
- uint\_least64\_t **vc\_get\_space\_mask** ()

- `int vc_get_cflags(xid_t xid, struct vc_ctx_flags *)`

### 6.2.1 Detailed Description

The public interface of the the libvserver library.

Definition in file [vserver.h](#).

### 6.2.2 Define Documentation

#### 6.2.2.1 #define VC\_DYNAMIC\_XID (([xid\\_t](#))(-1))

the value which means a random (the next free) ctx

Definition at line 68 of file [vserver.h](#).

#### 6.2.2.2 #define VC\_NOCTX (([xid\\_t](#))(-1))

the value which is returned in error-case (no ctx found)

Definition at line 65 of file [vserver.h](#).

#### 6.2.2.3 #define VC\_SAMECTX (([xid\\_t](#))(-2))

the value which means the current ctx

Definition at line 70 of file [vserver.h](#).

### 6.2.3 Typedef Documentation

#### 6.2.3.1 typedef uint\_least64\_t [vc\\_limit\\_t](#)

The type which is used for a single limit value.

Special values are

- VC\_LIM\_INFINITY ... which is the infinite value
- VC\_LIM\_KEEP ... which is used to mark values which shall not be modified by the [vc\\_set\\_rlimit\(\)](#) operation.

Else, the interpretation of the value depends on the corresponding resource; it might be bytes, pages, seconds or litres of beer.

Definition at line 429 of file vserver.h.

### 6.2.3.2 an\_unsigned\_integer\_type `xid_t`

The identifier of a context.

Definition at line 290 of file vserver.h.

## 6.2.4 Function Documentation

### 6.2.4.1 `int vc_add_dlimit (char const * filename, xid_t xid, uint_least32_t flags)`

Add a disk limit to a file system.

### 6.2.4.2 `int vc_createSkeleton (char const * id, vcCfgStyle style, int flags)`

Create a basic configuration skeleton for a vserver plus toplevel directories for pkgmanagment and filesystem (when requested).

### 6.2.4.3 `int vc_get_dlimit (char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit * limits)`

Get a disk limit.

### 6.2.4.4 `char* vc_getVserverAppDir (char const * id, vcCfgStyle style, char const * app)`

Returns the path of the configuration directory for the given application. The result will be allocated and must be freed by the caller.

### 6.2.4.5 `char* vc_getVserverByCtx (xid_t ctx, vcCfgStyle * style, char const * revdir)`

Resolves the cfg-path of the vserver owning the given ctx. 'revdir' will be used as the directory holding the mapping-links; when NULL, the default value will be assumed. The result will be allocated and must be freed by the caller.

### 6.2.4.6 `char* vc_getVserverCfgDir (char const * id, vcCfgStyle style)`

Returns the path of the vserver configuration directory. When the given vserver does not exist, or when it does not have such a directory, NULL will be returned. Else, the result will be allocated and must be freed by the caller.

### 6.2.4.7 `xid_t vc_getVserverCtx (char const * id, vcCfgStyle style, bool honor_static, bool * is_running)`

Returns the ctx of the given vserver. When vserver is not running and 'honor\_static' is false, VC\_NOCTX will be returned. Else, when 'honor\_static' is true and a static assignment exists, those value will be returned. Else, the result will be VC\_NOCTX.

When 'is\_running' is not null, the status of the vserver will be assigned to this variable.

**6.2.4.8** `char* vc_getVserverName (char const * id, vcCfgStyle style)`

Resolves the name of the vserver. The result will be allocated and must be freed by the caller.

**6.2.4.9** `char* vc_getVserverVdir (char const * id, vcCfgStyle style, bool physical)`

Returns the path to the vserver root-directory. The result will be allocated and must be freed by the caller.

**6.2.4.10** `bool vc_is_dynamic_xid (xid_t xid)`

Returns true iff *xid* is a dynamic xid

**6.2.4.11** `nid_t vc_nidopt2nid (char const *, bool honor_static, char const ** err_info)`

Maps a nid given at '-nid' options to a *nid\_t*

**6.2.4.12** `int vc_rem_dlimit (char const * filename, xid_t xid, uint_least32_t flags)`

Remove a disk limit from a file system.

**6.2.4.13** `int vc_set_dlimit (char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit const * limits)`

Set a disk limit.

**6.2.4.14** `xid_t vc_xidopt2xid (char const *, bool honor_static, char const ** err_info)`

Maps an xid given at '-xid' options to an *xid\_t*
